

VelocityDb Namespace

The **VelocityDb** name space contains classes for the VelocityDB Object Database.

Classes

| Class | Description |
|------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllObjects(T) | An object of this type is returned by AllObjects(T)(Boolean, Boolean) or AllObjects(T)(Boolean) |
|  AllObjects(T).AllObjectsIterator | Iterator of type AllObjects(T) |
|  AllObjectsExtension | A few extensions to improve performance of Linq for Objects queries |
|  AutoPlacement | This is the placement manager of objects persisted using Persist(Object) , it is automatically created when the first object of a type is persisted. It is the first object in the database of each type mapped Database. |
|  Database | Represents a Database which corresponds to file system file. |
|  DatabaseLocation | Represents a host and a directory in which a range of databases are stored. The range is a database number range. |
|  DatabaseLocations | Maintains collections of all existing DatabaseLocations . |
|  DataCache | Object maintains a list of pages accessed by a session, pages are removed from the list when there is not enough memory available. This makes such pages eligible for garbage collection while in list pages are prevented from being garbage collected. |
|  License | Contains a list of possible license attributes for licensing VelocityDb class library and server |
|  OfType | An object of this type is a base class of type returned by AllObjects(T)(Boolean, Boolean) or AllObjects(T)(Boolean) |
|  OfType.OfTypeIterator | Iterator for type OfType |
|  OfTypeExtension | A few extensions to improve performance of Linq for Objects queries |
|  OptimizedPersistable | Base class for all persistent capable classes except for embedded objects which do not need to be subclasses of this class. |
|  Page | Each Database consist of a number of variable sized pages. A page can be compressed and may be encrypted and contains one or more objects. Page compression is controlled by the DatabaseLocation of |

| | | |
|--------------------------------------------------------------------------------------------------------------------------------------------|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | the Database containing a page. Each page has a PageInfo that provides info about a page and can be updated to turn on/off compression and encryption for a specific page. |
|  PageCache | | Maintains string references to Pages within a Database |
|  PageInfo | | Each Page has a PageInfo that provides info about a page and can be used to turn on/off compression and encryption for a page. |
|  PageOffset | | Internally Used within VelocityDB and its extensions |
|  Placement | | This class is used when deciding where to place a new object persistently. That is we have a choice of database number, page number and page number. There is other ways to control the placement including ObjectsPerPage , PagesPerDatabase , and it is also possible to override Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) . |
|  ReferenceTracked | | Tracks references to this object and signals ReferentialIntegrityException if unpersisted before while still being referenced. |
|  WeakIOptimizedPersistableReference(T) | | When a persistent object is opened, all its referenced objects are opened as well. In order to limit the number of opened objects, you need to use this class. A reference from an instance of this class will not cause the referenced object to be opened. It will be opened when you ask for it. |
|  WeakIOptimizedPersistableReferenceBase | | This is the base class for all weak references. |
|  WeakIOptimizedPersistableReferenceX(T) | | Obsolete. Deprecated, use WeakIOptimizedPersistableReference instead (so name conflict can be avoided) When a persistent object is opened, all its referenced objects are opened as well. In order to limit the number of opened objects, you need to use this class. A reference from an instance of this class will not cause the referenced object to be opened. It will be opened when you ask for it. The Type of the weak referenced object, must be OptimizedPersistable |

Structures

| Structure | Description |
|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Oid | The object identifier containing a 32 bit database part, a 16 bit page part and a 16 bit page part. These parts are combined into a 64bit unsigned number Id . |
|  OidShort | The short object identifier containing a 16 bit page part and a 16 bit page part. This is used for short references within a single databases. |

Interfaces

| | Interface | Description |
|---|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| → | IOptimizedPersistable | add optimized persistence by implementing this interface. We provide OptimizedPersistable as a base class that implements this interface. |
| → | IReferenceTracked | Maintains a set of all References to this object |

Enumerations

| | Enumeration | Description |
|---|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| → | CacheEnum | Choices for object caching |
| → | OpFlags | Flag bits for a persistent object |
| → | PageInfo.compressionKind | Selection of choices for Page compression. |
| → | PageInfo.encryptionKind | Use desEncrypted for encrypted pages, set encryption private key in DatabaseLocation . Use noEncryption when no encryption is desired. Other choices in this enum are not yet publicly available. Other kinds of encryption can be provided upon request. We can even make the interface public allowing application defined encryption. |

AllObjects(T) Class

An object of this type is returned by [AllObjects\(T\)\(Boolean, Boolean\)](#) or [AllObjects\(T\)\(Boolean\)](#)

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OfType](#)

VelocityDb.AllObjects(T)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class AllObjects<T> : OfType,  
    IEnumerable<T>, IEnumerable
```

VB

```
Public Class AllObjects(Of T)  
    Inherits OfType  
    Implements IEnumerable(Of T), IEnumerable
```

C++

```
generic<typename T>  
public ref class AllObjects : public OfType,  
    IEnumerable<T>, IEnumerable
```

F#

```
type AllObjects<'T> =  
    class  
        inherit OfType  
        interface IEnumerable<'T>  
        interface IEnumerable  
    end
```

Type Parameters

T

The object type we are looking for in the iteration (enumeration)

The AllObjects(T) type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------------|--------------------------------------------|
|  | AllObjects(T)(BTreeSet(T)) | Constructs this enumeration wrapper object |

| | | |
|-----------------------------------------------------------------------------------|--------------------------------------------------------------|--------------------------------------------|
|  | AllObjects(T)(Database, Boolean) | Constructs this enumeration wrapper object |
|  | AllObjects(T)(SessionBase, Boolean, Boolean) | Constructs this enumeration wrapper object |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------|--------------------------------------------|
|  | Count | Get a count of instances of the given type |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|--------------------------------------|
|  | GetEnumerator | Enumeration of all objects of type T |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Count(T) | Override to improve performance over IEnumerable LINQ extension (Defined by AllObjectsExtension .) |
|  | ElementAt(Int32) | Overloaded. Override LINQ for faster access (Defined by OfTypeExtension .) |
|  | ElementAt(T)(Int32) | Overloaded. Override LINQ for faster access (Defined by AllObjectsExtension .) |
|  | Skip(Int32) | Overloaded. Bypasses a specified number of elements in a sequence and then returns the remaining elements. (Defined by OfTypeExtension .) |
|  | Skip(TSource)(Int32) | Overloaded. Bypasses a specified number of elements in a sequence and then returns the remaining elements. Overrides Skip(TSource)(IEnumerable(TSource), Int32) for improved performance (Defined by AllObjectsExtension .) |

[AllObjects\(T\)Class](#)

[VelocityDb Namespace](#)

AllObjects(T) Constructor (BTreeSet(T))

Constructs this enumeration wrapper object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public AllObjects (  
    BTreeSet<T> bTree  
)
```

VB

```
Public Sub New (  
    bTree As BTreeSet(Of T)  
)
```

C++

```
public:  
AllObjects (  
    BTreeSet<T>^ bTree  
)
```

F#

```
new :  
    bTree : BTreeSet<'T> -> AllObjects
```

Parameters

bTree

Type: [VelocityDb.Collection.BTree.BTreeSet\(T\)](#)

A collection

See Also

[AllObjects\(T\)Class](#)

[AllObjects\(T\)Overload](#)

[VelocityDb Namespace](#)

AllObjects(T) Constructor (Database, Boolean)

Constructs this enumeration wrapper object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public AllObjects(  
    Database db,  
    bool includeSubclasses = false  
)
```

VB

```
Public Sub New (  
    db As Database,  
    Optional includeSubclasses As Boolean = false  
)
```

C++

```
public:  
AllObjects(  
    Database^ db,  
    bool includeSubclasses = false  
)
```

F#

```
new :  
    db : Database *  
    ?includeSubclasses : bool  
(* Defaults:  
    let_includeSubclasses = defaultArg includeSubclasses false  
)  
-> AllObjects
```

Parameters

db

Type: [VelocityDb.Database](#)

The active db

includeSubclasses (Optional)

Type: [System.Boolean](#)

Also return instances of sub classes

See Also

[AllObjects\(T\)Class](#)

[AllObjects\(T\)Overload](#)

VelocityDB Class Library

[VelocityDb Namespace](#)

AllObjects(T) Constructor (SessionBase, Boolean, Boolean)

Constructs this enumeration wrapper object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public AllObjects(  
    SessionBase session,  
    bool includeSubclasses,  
    bool databasePerType  
)
```

VB

```
Public Sub New (  
    session As SessionBase,  
    includeSubclasses As Boolean,  
    databasePerType As Boolean  
)
```

C++

```
public:  
AllObjects(  
    SessionBase^ session,  
    bool includeSubclasses,  
    bool databasePerType  
)
```

F#

```
new :  
    session : SessionBase *  
    includeSubclasses : bool *  
    databasePerType : bool -> AllObjects
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

includeSubclasses

Type: [System.Boolean](#)

Also return instances of sub classes

databasePerType

Type: [System.Boolean](#)

VelocityDB Class Library

Assume that persisted objects were made persistent the simple way using [Persist\(IOptimizedPersistable, Nullable\(UInt16\)\)](#). When persisting this way, each object type gets its own [Database](#) which makes finding these objects easier and faster

See Also

[AllObjects\(T\)Class](#)

[AllObjects\(T\)Overload](#)

[VelocityDb Namespace](#)

AllObjects(T).AllObjects(T) Properties

The [AllObjects\(T\)](#) generic type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------|--------------------------------------------|
|  | Count | Get a count of instances of the given type |

See Also

[AllObjects\(T\)Class](#)

[VelocityDb Namespace](#)

AllObjects(T).Count Property

Get a count of instances of the given type

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong Count { get; }
```

VB

```
Public ReadOnly Property Count As ULong  
    Get
```

C++

```
public:  
property unsigned long long Count {  
    unsigned long long get ();  
}
```

F#

```
member Count : uint64 with get
```

Property Value

Type: [UInt64](#)

See Also

[AllObjects\(T\)Class](#)

[VelocityDb Namespace](#)

AllObjects(T).AllObjects(T) Methods

The [AllObjects\(T\)](#) generic type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|--------------------------------------|
|  | GetEnumerator | Enumeration of all objects of type T |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Count(T) | Override to improve performance over IEnumerable LINQ extension (Defined by AllObjectsExtension.) |
|  | ElementAt(Int32) | Overloaded. Override LINQ for faster access (Defined by OfTypeExtension.) |
|  | ElementAt(T)(Int32) | Overloaded. Override LINQ for faster access (Defined by AllObjectsExtension.) |
|  | Skip(Int32) | Overloaded. Bypasses a specified number of elements in a sequence and then returns the remaining elements. (Defined by OfTypeExtension.) |
|  | Skip(TSource)(Int32) | Overloaded. Bypasses a specified number of elements in a sequence and then returns the remaining elements. Overrides Skip(TSource)(IEnumerable(TSource), Int32) for improved performance (Defined by AllObjectsExtension.) |

See Also

[AllObjects\(T\)Class](#)

[VelocityDb Namespace](#)

AllObjects(T).GetEnumerator Method

Enumeration of all objects of type T

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable<T> GetEnumerator ()
```

VB

```
Public Function GetEnumerator As IEnumerable(Of T)
```

C++

```
public:  
virtual IEnumerable<T>^ GetEnumerator () sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerable<'T>  
override GetEnumerator : unit -> IEnumerable<'T>
```

Return Value

Type: [IEnumerable\(T\)](#)

The enumerator of T

Implements

[IEnumerable\(T\).GetEnumerator\(\)](#)

See Also

[AllObjects\(T\)Class](#)

[VelocityDb Namespace](#)

AllObjects(T).AllObjectsIterator Class

Iterator of type [AllObjects\(T\)](#)

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OfType.OfTypeIterator](#)

VelocityDb.AllObjects(T).AllObjectsIterator

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class AllObjectsIterator : OfType.OfTypeIterator,  
    IEnumerable<T>, IEnumerable
```

VB

```
Public Class AllObjectsIterator  
    Inherits OfType.OfTypeIterator  
    Implements IEnumerable(Of T), IEnumerable
```

C++

```
public ref class AllObjectsIterator : public OfType.OfTypeIterator,  
    IEnumerable<T>, IEnumerable
```

F#

```
type AllObjectsIterator =  
    class  
        inherit OfType.OfTypeIterator  
        interface IEnumerable<'T>  
        interface IEnumerable  
    end
```

The AllObjects(T).AllObjectsIterator generic type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|-------------------------------------------------------------|
|  | GetEnumerator | Returns an enumerator that iterates through the collection. |

See Also

[VelocityDb Namespace](#)

AllObjectsIterator.AllObjectsIterator Methods

The [AllObjects\(T\).AllObjectsIterator](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|-------------------------------------------------------------|
|  | GetEnumerator | Returns an enumerator that iterates through the collection. |

See Also

[AllObjects\(T\).AllObjectsIterator Class](#)

[VelocityDb Namespace](#)

AllObjects(T).AllObjectsIterator.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerator<T> GetEnumerator ()
```

VB

```
Public Function GetEnumerator As IEnumerator(Of T)
```

C++

```
public:  
virtual IEnumerator<T>^ GetEnumerator () sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerator<'T>  
override GetEnumerator : unit -> IEnumerator<'T>
```

Return Value

Type: [IEnumerator\(T\)](#)

An enumerator that can be used to iterate through the collection.

Implements

[IEnumerable\(T\).GetEnumerator\(\)](#)

See Also

[AllObjects\(T\).AllObjectsIterator Class](#)

[VelocityDb Namespace](#)

AllObjectsExtension Class

A few extensions to improve performance of Linq for Objects queries

Inheritance Hierarchy

[System.Object](#)

VelocityDb.AllObjectsExtension

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static class AllObjectsExtension
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class AllObjectsExtension
```

C++

```
[ExtensionAttribute]  
public ref class AllObjectsExtension abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type AllObjectsExtension = class end
```

The **AllObjectsExtension** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Count(T) | Override to improve performance over IEnumerable LINQ extension |
|   | ElementAt(T) | Override LINQ for faster access |
|   | Skip(TSource) | Bypasses a specified number of elements in a sequence and then returns the remaining elements. Overrides Skip(TSource)(IEnumerable(TSource), Int32) for improved performance |

See Also

[VelocityDb Namespace](#)

AllObjectsExtension.AllObjectsExtension Methods

The [AllObjectsExtension](#) type exposes the following members.

Methods

| | Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Count(T) | Override to improve performance over IEnumerable LINQ extension |
|   | ElementAt(T) | Override LINQ for faster access |
|   | Skip(TSource) | Bypasses a specified number of elements in a sequence and then returns the remaining elements. Overrides Skip(TSource)(IEnumerable(TSource), Int32) for improved performance |

See Also

[AllObjectsExtension Class](#)

[VelocityDb Namespace](#)

AllObjectsExtension.Count(T) Method

Override to improve performance over IEnumerable LINQ extension

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static int Count<T>(
    this AllObjects<T> sourceCollection
)
```

VB

```
<ExtensionAttribute>
Public Shared Function Count(Of T) (
    sourceCollection As AllObjects(Of T)
) As Integer
```

C++

```
public:
    [ExtensionAttribute]
    generic<typename T>
    static int Count(
        AllObjects<T>^ sourceCollection
    )
```

F#

```
[<ExtensionAttribute>]
static member Count :
    sourceCollection : AllObjects<'T> -> int
```

Parameters

sourceCollection

Type: [VelocityDb.AllObjects\(T\)](#)

the collection

Type Parameters

T

key type

Return Value

Type: [Int32](#)

Size of the collection

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [AllObjects\(T\)](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

See Also

[AllObjectsExtension Class](#)

[VelocityDb Namespace](#)

AllObjectsExtension.ElementAt(*T*) Method

Override LINQ for faster access

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static T ElementAt<T>(
    this AllObjects<T> source,
    int index
)
```

VB

```
<ExtensionAttribute>
Public Shared Function ElementAt(Of T) (
    source As AllObjects(Of T),
    index As Integer
) As T
```

C++

```
public:
[ExtensionAttribute]
generic<typename T>
static T ElementAt(
    AllObjects<T>^ source,
    int index
)
```

F#

```
[<ExtensionAttribute>]
static member ElementAt :
    source : AllObjects<'T> *
    index : int -> 'T
```

Parameters

source

Type: [VelocityDb.AllObjects\(*T*\)](#)

The source enumeration

index

Type: [System.Int32](#)

The index requested

Type Parameters

T

VelocityDB Class Library

The type of element requested

Return Value

Type: **T**

Element at requested index

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [AllObjects\(T\)](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

See Also

[AllObjectsExtension Class](#)

[VelocityDb Namespace](#)

AllObjectsExtension.Skip(TSource) Method

Bypasses a specified number of elements in a sequence and then returns the remaining elements. Overrides [Skip\(TSource\)\(IEnumerable\(TSource\), Int32\)](#) for improved performance

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IEnumerable<TSource> Skip<TSource>(
    this AllObjects<TSource> source,
    int count
)
```

VB

```
<ExtensionAttribute>
Public Shared Function Skip(Of TSource) (
    source As AllObjects(Of TSource),
    count As Integer
) As IEnumerable(Of TSource)
```

C++

```
public:
[ExtensionAttribute]
generic<typename TSource>
static IEnumerable<TSource>^ Skip(
    AllObjects<TSource>^ source,
    int count
)
```

F#

```
[<ExtensionAttribute>]
static member Skip :
    source : AllObjects<'TSource> *
    count : int -> IEnumerable<'TSource>
```

Parameters

source

Type: [VelocityDb.AllObjects\(TSource\)](#)

Source collection

count

Type: [System.Int32](#)

The number of elements to skip before returning the remaining elements.

VelocityDB Class Library

Type Parameters

TSource

The type of the elements of source

Return Value

Type: [IEnumerable\(TSource\)](#)

An [IEnumerable\(T\)](#) that contains the elements that occur after the specified index in the input sequence.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [AllObjects\(TSource\)](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[AllObjectsExtension Class](#)

[VelocityDb Namespace](#)

AutoPlacement Class

This is the placement manager of objects persisted using [Persist\(Object\)](#), it is automatically created when the first object of a type is persisted. It is the first object in the database of each type mapped Database.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

[VelocityDb.Placement](#)

VelocityDb.AutoPlacement

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class AutoPlacement : Placement
```

VB

```
<SerializableAttribute>
Public Class AutoPlacement
    Inherits Placement
```

C++

```
[SerializableAttribute]
public ref class AutoPlacement : public Placement
```

F#

```
[<SerializableAttribute>]
type AutoPlacement =
    class
        inherit Placement
    end
```

The **AutoPlacement** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|
|  | Cache | We want to cache all AutoPlacement objects (small and frequently used) (Overrides OptimizedPersistable.Cache.) |
|  | Count | Get the total number of created objects of this type |
|  | Counter | Get the total number of created objects of this type |

Methods

| | Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
|  | IncrementTryDatabaseNumber | Moves to a new Database number used when placing (persisting) objects (Overrides Placement.IncrementTryDatabaseNumber() .) |
|  | InitializeAfterRead | (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase) .) |
|   | Open | Tries to open AutoPlacement object for a given database |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

See Also

[VelocityDb Namespace](#)

AutoPlacement.AutoPlacement Properties

The [AutoPlacement](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|
|  | Cache | We want to cache all AutoPlacement objects (small and frequently used) (Overrides OptimizedPersistable.Cache.) |
|  | Count | Get the total number of created objects of this type |
|  | Counter | Get the total number of created objects of this type |

See Also

[AutoPlacement Class](#)

[VelocityDb Namespace](#)

AutoPlacement.Cache Property

We want to cache all AutoPlacement objects (small and frequently used)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override CacheEnum Cache { get; }
```

VB

```
Public Overrides ReadOnly Property Cache As CacheEnum  
    Get
```

C++

```
public:  
virtual property CacheEnum Cache {  
    CacheEnum get () override;  
}
```

F#

```
abstract Cache : CacheEnum with get  
override Cache : CacheEnum with get
```

Property Value

Type: [CacheEnum](#)

Implements

[IOptimizedPersistable.Cache](#)

See Also

[AutoPlacement Class](#)

[VelocityDb Namespace](#)

AutoPlacement.Count Property

Get the total number of created objects of this type

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong Count { get; }
```

VB

```
Public ReadOnly Property Count As ULong  
    Get
```

C++

```
public:  
property unsigned long long Count {  
    unsigned long long get ();  
}
```

F#

```
member Count : uint64 with get
```

Property Value

Type: [UInt64](#)

See Also

[AutoPlacement Class](#)

AutoPlacement.Counter Property

Get the total number of created objects of this type

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong Counter { get; set; }
```

VB

```
Public Property Counter As ULong  
    Get  
    Set
```

C++

```
public:  
property unsigned long long Counter {  
    unsigned long long get ();  
    void set (unsigned long long value);  
}
```

F#

```
member Counter : uint64 with get, set
```

Property Value

Type: [UInt64](#)

AutoPlacement.AutoPlacement Methods

The [AutoPlacement](#) type exposes the following members.

Methods

| | Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
|  | IncrementTryDatabaseNumber | Moves to a new Database number used when placing (persisting) objects (Overrides Placement.IncrementTryDatabaseNumber() .) |
|  | InitializeAfterRead | (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase) .) |
|   | Open | Tries to open AutoPlacement object for a given database |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

AutoPlacement.IncrementTryDatabaseNumber Method

Moves to a new Database number used when placing (persisting) objects

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override uint IncrementTryDatabaseNumber ()
```

VB

```
Public Overrides Function IncrementTryDatabaseNumber As UInteger
```

C++

```
public:  
virtual unsigned int IncrementTryDatabaseNumber () override
```

F#

```
abstract IncrementTryDatabaseNumber : unit -> uint32  
override IncrementTryDatabaseNumber : unit -> uint32
```

Return Value

Type: [UInt32](#)

The Database number before incrementing

AutoPlacement.InitializeAfterRead Method

[Missing <summary> documentation for "M:VelocityDb.AutoPlacement.InitializeAfterRead(VelocityDb.Session.SessionBase)"]

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRead(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRead (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRead(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRead :  
    session : SessionBase -> unit  
override InitializeAfterRead :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for "M:VelocityDb.AutoPlacement.InitializeAfterRead(VelocityDb.Session.SessionBase)"]

Implements

[IOptimizedPersistable.InitializeAfterRead\(SessionBase\)](#)

See Also

[AutoPlacement Class](#)

[VelocityDb Namespace](#)

AutoPlacement.Open Method

Tries to open [AutoPlacement](#) object for a given database

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IOptimizedPersistable Open(  
    SessionBase session,  
    uint databaseNumber,  
    ushort objectsPerPage,  
    bool usesAutoIncrement  
)
```

VB

```
Public Shared Function Open (  
    session As SessionBase,  
    databaseNumber As UInteger,  
    objectsPerPage As UShort,  
    usesAutoIncrement As Boolean  
) As IOptimizedPersistable
```

C++

```
public:  
static IOptimizedPersistable^ Open(  
    SessionBase^ session,  
    unsigned int databaseNumber,  
    unsigned short objectsPerPage,  
    bool usesAutoIncrement  
)
```

F#

```
static member Open :  
    session : SessionBase *  
    databaseNumber : uint32 *  
    objectsPerPage : uint16 *  
    usesAutoIncrement : bool -> IOptimizedPersistable
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

Active session

databaseNumber

Type: [System.UInt32](#)

Database number used by [Type](#) using this [AutoPlacement](#)

objectsPerPage

Type: [System.UInt16](#)

Requested max number of objects per page

usesAutoIncrement

Type: [System.Boolean](#)

Type for which [AutoPlacement](#) is used must not use any auto increment fields or else parallel add of this object type is not possible with simple persist.

Return Value

Type: [IOptimizedPersistable](#)

`null` if doesn't exist, the persistent [AutoPlacement](#) object if we able to read it from the [Database](#) without a lock conflict, a transient [AutoPlacement](#) if auto increment isn't used and we get a lock conflict; otherwise throw lock conflict exception

CacheEnum Enumeration

Choices for object caching

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public enum CacheEnum
```

VB

```
Public Enumeration CacheEnum
```

C++

```
public enum class CacheEnum
```

F#

```
type CacheEnum
```

Members

| Member name | Value | Description |
|-------------------------|-------|---------------------------------------------|
| No | 0 | Do not cache |
| Yes | 1 | Always cache |
| is64Bit | 2 | Cache if running as 64 bit process |
| RamAvailable5Gb | 3 | Cache if at least 5GB memory is available |
| RamAvailable10Gb | 4 | Cache if at least 10GB memory is available |
| RamAvailable20Gb | 5 | Cache if at least 20GB memory is available |
| Available100Gb | 6 | Cache if at least 100GB memory is available |

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Database

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class Database : OptimizedPersistable, IEnumerable<Page>, IEnumerable, IEqualityComparer<Database>, IDisposable
```

VB

```
<SerializableAttribute>  
Public Class Database  
    Inherits OptimizedPersistable  
    Implements IEnumerable(Of Page), IEnumerable, IEqualityComparer(Of Database), IDisposable
```

C++

```
[SerializableAttribute]  
public ref class Database : public OptimizedPersistable, IEnumerable<Page^>, IEnumerable, IEqualityComparer<Database^>, IDisposable
```

F#

```
[<SerializableAttribute>]  
type Database =  
    class  
        inherit OptimizedPersistable  
        interface IEnumerable<Page>  
        interface IEnumerable  
        interface IEqualityComparer<Database>  
        interface IDisposable  
    end
```

The **Database** type exposes the following members.

Properties

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | We want to be sure that the object representing a Database can share its page with other objects so override <code>AllowOtherTypesOnSamePage</code> and return true. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage .) |
|  CachedVerified | Setting this property to false will trigger a comparison of the cached version of the Database with the on disk version. Each new transaction also sets this property to false for all cached databases. You may alternatively use the session API <code>ForceDatabaseCacheValidation()</code> to trigger validation of all cached databases. Setting it to false when the Database has been updated in the current transaction is ignored. |
|  FileInfo | FileInfo for this Database , not set for <code>ServerClientSession</code> |
|  FileStream | Stream used for reading and writing this Database |
|  HighestPageNumber | Indicates the highest <code>tryPageNumber</code> number currently in use for this database. |
|  IsDeleted | Gets info about this Database about to be deleted or not. |
|  IsLocal | Gets info about this Database being on the local host or not. |
|  IsNew | Indicates if database was created in the current <code>transactionNumber</code> |
|  IsUpdated | Gets the updated state of the object (Overrides OptimizedPersistable.IsUpdated .) |
|  Location | The <code>DatabaseLocation</code> of this Database |
|  Name | Optional name associated with a Database |
|  NumberOfPages | Indicates how many pages this database contains. |
|  ObjectCachingDefaultPolicy | Default strategy for this Database , defaults to ObjectCachingDefaultPolicy . (strategy is not persisted) |
|  PageCacheEnabled | Turns on or off Page caching for this Database |
|  PageOffset | |

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllObjects(T) | Gets an object used for enumerating all objects in this Database |
|  Bytes | Avoid using this one for now, internal use. |
|  CachedPage | Try to retrieve a cached Page |
|  CloneAs | Any Database that only uses <code>OidShort</code> references can be cloned without changing any of the internals of the Database. This function simply copies the |

| | | |
|-----------------------------------------------------------------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | Database file. It is the user's responsibility to know that only OidShort references are used within the Database or else such references will still keep the original Database number. |
|  | Dispose | Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. |
|  | Equals(Database) | Compares by version and page 0 offset |
|  | Equals(Database, Database) | Determines whether the specified objects are equal. |
|  | GetEnumerator | Gets an enumerable sequence of all the pages in this database. |
|  | GetHashCode | Returns a hash code for the specified object. |
|  | OfType | Gets an object used for enumerating all objects in this Database."/> |
|  | Pages | Gets an enumerable sequence of all the pages in this database. |
|  | ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion, Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  | ToString | Displays class name plus object id (Overrides OptimizedPersistable.ToString().) |
|  | WritePageBytes | |

Fields

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------------------------|-------------|
|  | InitialReservedDatabaseNumbers | |
|  | m_guid | |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Database.AllowOtherTypesOnSamePage Property

We want to be sure that the object representing a Database can share its page with other objects so override AllowOtherTypesOnSamePage and return true.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool AllowOtherTypesOnSamePage { get; }
```

VB

```
Public Overrides ReadOnly Property AllowOtherTypesOnSamePage As Boolean  
    Get
```

C++

```
public:  
virtual property bool AllowOtherTypesOnSamePage {  
    bool get () override;  
}
```

F#

```
abstract AllowOtherTypesOnSamePage : bool with get  
override AllowOtherTypesOnSamePage : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.AllowOtherTypesOnSamePage](#)

Database.Database Methods

The [Database](#) type exposes the following members.

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllObjects(T) | Gets an object used for enumerating all objects in this Database |
|  Bytes | Avoid using this one for now, internal use. |
|  CachedPage | Try to retrieve a cached Page |
|  CloneAs | Any Database that only uses OidShort references can be cloned without changing any of the internals of the Database. This function simply copies the Database file. It is the user's responsibility to know that only OidShort references are used within the Database or else such references will still keep the original Database number. |
|  Dispose | Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. |
|  Equals(Database) | Compares by version and page 0 offset |
|  Equals(Database, Database) | Determines whether the specified objects are equal. |
|  GetEnumerator | Gets an enumerable sequence of all the pages in this database. |
|  GetHashCode | Returns a hash code for the specified object. |
|  OfType | Gets an object used for enumerating all objects in this Database."/> |
|  Pages | Gets an enumerable sequence of all the pages in this database. |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  ToString | Displays class name plus object id (Overrides OptimizedPersistable.ToString().) |
|  WritePageBytes | |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Database.AllObjects(T) Method

Gets an object used for enumerating all objects in this Database

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public AllObjects<T> AllObjects<T>(
    bool includeSubClasses = true
)
```

VB

```
Public Function AllObjects(Of T) (
    Optional includeSubClasses As Boolean = true
) As AllObjects(Of T)
```

C++

```
public:
generic<typename T>
AllObjects<T>^ AllObjects(
    bool includeSubClasses = true
)
```

F#

```
member AllObjects :
    ?includeSubClasses : bool
(* Defaults:
    let_includeSubClasses = defaultArg includeSubClasses true
*)
-> AllObjects<'T>
```

Parameters

includeSubClasses (Optional)

Type: [System.Boolean](#)

Also return instances of sub classes

Type Parameters

T

The type of object we are looking for

Return Value

Type: [AllObjects\(T\)](#)

The enumeration wrapper object

VelocityDB Class Library

Try to retrieve a cached [Page](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Page CachedPage (  
    ushort pageNumber  
)
```

VB

```
Public Function CachedPage (  
    pageNumber As UShort  
) As Page
```

C++

```
public:  
Page^ CachedPage (  
    unsigned short pageNumber  
)
```

F#

```
member CachedPage :  
    pageNumber : uint16 -> Page
```

Parameters

pageNumber

Type: [System.UInt16](#)

Page number of page to look for in cache

Return Value

Type: [Page](#)

[Page](#) if found in cache; otherwise null

See Also

Database.CloneAs Method

Any Database that only uses OidShort references can be cloned without changing any of the internals of the Database. This function simply copies the Database file. It is the user's responsibility to know that only OidShort references are used within the Database or else such references will still keep the original Database number.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Database CloneAs(  
    uint otherAvaialbleDatabaseNumber  
)
```

VB

```
Public Function CloneAs (  
    otherAvaialbleDatabaseNumber As UInteger  
) As Database
```

C++

```
public:  
Database^ CloneAs(  
    unsigned int otherAvaialbleDatabaseNumber  
)
```

F#

```
member CloneAs :  
    otherAvaialbleDatabaseNumber : uint32 -> Database
```

Parameters

otherAvaialbleDatabaseNumber

Type: [System.UInt32](#)

The desired Id of the Database clone

Return Value

Type: [Database](#)

The Database clone

Database.Dispose Method

Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Dispose ()
```

VB

```
Public Sub Dispose
```

C++

```
public:  
virtual void Dispose () sealed
```

F#

```
abstract Dispose : unit -> unit  
override Dispose : unit -> unit
```

Implements

[IDisposable.Dispose\(\)](#)

Database.Equals Method (Database)

Compares by version and page 0 offset

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Equals(  
    Database other  
)
```

VB

```
Public Function Equals (  
    other As Database  
) As Boolean
```

C++

```
public:  
bool Equals(  
    Database^ other  
)
```

F#

```
member Equals :  
    other : Database -> bool
```

Parameters

other

Type: [VelocityDb.Database](#)

Other [Database](#) object

Return Value

Type: [Boolean](#)

true if matching; otherwise false

[Equals Overload](#)

[VelocityDb Namespace](#)

Database.Equals Method (Database, Database)

Determines whether the specified objects are equal.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Equals(  
    Database x,  
    Database y  
)
```

VB

```
Public Function Equals (  
    x As Database,  
    y As Database  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    Database^ x,  
    Database^ y  
) sealed
```

F#

```
abstract Equals :  
    x : Database *  
    y : Database -> bool  
override Equals :  
    x : Database *  
    y : Database -> bool
```

Parameters

x

Type: [VelocityDb.Database](#)

The first object of type *T* to compare.

y

Type: [VelocityDb.Database](#)

The second object of type *T* to compare.

Return Value

Type: [Boolean](#)

`true` (True in Visual Basic) if the specified objects are equal; otherwise, `false` (False in Visual Basic).

VelocityDB Class Library

Implements

[IEqualityComparer\(T\).Equals\(T, T\)](#)

Database.GetEnumerator Method

Gets an enumerable sequence of all the pages in this database.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable<Page> GetEnumerator ()
```

VB

```
Public Function GetEnumerator As IEnumerable(Of Page)
```

C++

```
public:  
virtual IEnumerable<Page^> GetEnumerator () sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerable<Page>  
override GetEnumerator : unit -> IEnumerable<Page>
```

Return Value

Type: [IEnumerable\(Page\)](#)

Enumeration of pages in a Database

Implements

[IEnumerable\(T\).GetEnumerator\(\)](#)

See Also

[Database Class](#)

[VelocityDb Namespace](#)

Database.GetHashCode Method

Returns a hash code for the specified object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int GetHashCode(  
    Database db  
)
```

VB

```
Public Function GetHashCode (  
    db As Database  
) As Integer
```

C++

```
public:  
virtual int GetHashCode(  
    Database^ db  
) sealed
```

F#

```
abstract GetHashCode :  
    db : Database -> int  
override GetHashCode :  
    db : Database -> int
```

Parameters

db

Type: [VelocityDb.Database](#)

[Missing <param name="db"/> documentation for "M:VelocityDb.Database.GetHashCode(VelocityDb.Database)"]

Return Value

Type: [Int32](#)

A hash code for the specified object.

Implements

[IEqualityComparer\(T\).GetHashCode\(T\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------|
| ArgumentNullException | The type of <i>obj</i> is a reference type and <i>obj</i> is a null reference (<i>Nothing</i> in Visual Basic). |

Database.OfType Method

Gets an object used for enumerating all objects in this Database."/>

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public OfType OfType(  
    Type type,  
    bool includeSubClasses = true  
)
```

VB

```
Public Function OfType (  
    type As Type,  
    Optional includeSubClasses As Boolean = true  
) As OfType
```

C++

```
public:  
OfType^ OfType(  
    Type^ type,  
    bool includeSubClasses = true  
)
```

F#

```
member OfType :  
    type : Type *  
    ?includeSubClasses : bool  
(* Defaults:  
    let _includeSubClasses = defaultArg includeSubClasses true  
)  
-> OfType
```

Parameters

type

Type: [System.Type](#)

Type to look for

includeSubClasses (Optional)

Type: [System.Boolean](#)

Also return instances of sub classes

Return Value

Type: [OfType](#)

The enumeration wrapper **OfType(Type, Boolean)**object

DatabaseLocation Class

Represents a host and a directory in which a range of databases are stored. The range is a database number range.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.DatabaseLocation

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class DatabaseLocation : OptimizedPersistable,
    IComparable
```

VB

```
<SerializableAttribute>
Public Class DatabaseLocation
    Inherits OptimizedPersistable
    Implements IComparable
```

C++

```
[SerializableAttribute]
public ref class DatabaseLocation : public OptimizedPersistable,
    IComparable
```

F#

```
[<SerializableAttribute>]
type DatabaseLocation =
    class
        inherit OptimizedPersistable
        interface IComparable
    end
```

The **DatabaseLocation** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|  | DatabaseLocation(String, String, UInt32, UInt32, SessionBase) | Creates a transient Database location. A transient DatabaseLocation is made persistent by NewLocation(DatabaseLocation) |

| | | |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|  | DatabaseLocation(String, String, UInt32, UInt32, SessionBase, PageInfo.compressionKind, PageInfo.encryptionKind, Boolean, DatabaseLocation) | Creates a transient Database location. A transient DatabaseLocation is made persistent by NewLocation(DatabaseLocation) |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|

Properties

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|  BackupOfOrForLocation | Gets a linked DatabaseLocation that is either backup of location or is the location being backup up which is decided by IsBackupLocation |
|  Cache | We do want to cache this kind of object since they are likely to be frequently used. (Overrides OptimizedPersistable.Cache.) |
|  CompressPages | Gets page compression info |
|  DesKey | Gets the Des encryption key from a .des file in user Documents folder. (Environment.SpecialFolder.MyDocuments) |
|  DirectoryPath | Gets the full path to the directory hosting databases |
|  EndDatabaseNumber | Gets or sets the last database number within the range of databases for this location |
|  HostName | Gets the host name of this database location |
|  IsBackupLocation | Tells if this is a location used for backing up databases. |
|  IsDefaultLocation | Is this the default DatabaseLocation where Database 0, 1, 2, 3, 4 may be stored? |
|  IsLocal | Gets info about this location being on the local host or not. |
|  PageEncryption | Gets the encryption kind attribute. |
|  PlacementDatabaseNumber | Hint about where to persist DatabaseLocation (Overrides OptimizedPersistable.PlacementDatabaseNumber.) |
|  Replicas | |
|  RsaPrivateXmlKey | The rsaPrivateXmlKey data field is not persisted but can be set and read with this property |
|  RsaPublicXmlKey | The rsaPublicXmlKey data field is not persisted but can be set and read with this property |
|  RsaSignature | The rsaSignature data field is not persisted but can be set and read with this property |
|  StartDatabaseNumber | Gets and sets the start of the range of Database numbers for this location. |

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  CompareTo | The default compare of two DatabaseLocation is by host name and directory (Overrides OptimizedPersistable.CompareTo(Object).) |
|  ContainsDatabase | Check if this location contains a particular Database |
|  ContainsNewDatabase | Check if this location contains a particular new database (not yet committed) Database |
|  DatabasePath | Get the full path to a Database |
|  Databases | Enumerates all Databases of this location |
|  InitializeAfterRead | Sets the desKey field for desEncrypted locations by reading .des file in Environment.SpecialFolder.MyDocuments (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase).) |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  Persist | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. (Overrides OptimizedPersistable.Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)).) |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation Constructor (String, String, UInt32, UInt32, SessionBase)

Creates a transient Database location. A transient DatabaseLocation is made persistent by [NewLocation\(DatabaseLocation\)](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DatabaseLocation(  
    string inHost,  
    string dir,  
    uint dbStartNum,  
    uint dbEndNum,  
    SessionBase session  
)
```

VB

```
Public Sub New (  
    inHost As String,  
    dir As String,  
    dbStartNum As UInteger,  
    dbEndNum As UInteger,  
    session As SessionBase  
)
```

C++

```
public:  
DatabaseLocation(  
    String^ inHost,  
    String^ dir,  
    unsigned int dbStartNum,  
    unsigned int dbEndNum,  
    SessionBase^ session  
)
```

F#

```
new :  
    inHost : string *  
    dir : string *  
    dbStartNum : uint32 *  
    dbEndNum : uint32 *  
    session : SessionBase -> DatabaseLocation
```

Parameters

inHost

Type: [System.String](#)

VelocityDB Class Library

Hostname of the computer with the DatabaseLocation directory.

dir

Type: [System.String](#)

The full path of the directory

dbStartNum

Type: [System.UInt32](#)

The first Database Id number for this location

dbEndNum

Type: [System.UInt32](#)

The last Database Id number for this location.

session

Type: [VelocityDb.Session.SessionBase](#)

The active session used for creating the location.

[DatabaseLocation Class](#)

[DatabaseLocation Overload](#)

[VelocityDb Namespace](#)

DatabaseLocation Constructor (String, String, UInt32, UInt32, SessionBase, PageInfo.compressionKind, PageInfo.encryptedKind, Boolean, DatabaseLocation)

Creates a transient Database location. A transient DatabaseLocation is made persistent by [NewLocation\(DatabaseLocation\)](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DatabaseLocation(  
    string inHost,  
    string dir,  
    uint dbStartNum,  
    uint dbEndNum,  
    SessionBase session,  
    PageInfo.compressionKind compressPages,  
    PageInfo.encryptedKind pageEncryption =  
PageInfo.encryptedKind.noEncryption,  
    bool isAbackupLocation = false,  
    DatabaseLocation backupOfOrForLocation = null  
)
```

VB

```
Public Sub New (  
    inHost As String,  
    dir As String,  
    dbStartNum As UInteger,  
    dbEndNum As UInteger,  
    session As SessionBase,  
    compressPages As PageInfo.compressionKind,  
    Optional pageEncryption As PageInfo.encryptedKind =  
PageInfo.encryptedKind.noEncryption,  
    Optional isAbackupLocation As Boolean = false,  
    Optional backupOfOrForLocation As DatabaseLocation = Nothing  
)
```

C++

```
public:  
DatabaseLocation(  
    String^ inHost,  
    String^ dir,  
    unsigned int dbStartNum,  
    unsigned int dbEndNum,  
    SessionBase^ session,  
    PageInfo.compressionKind compressPages,  
    PageInfo.encryptedKind pageEncryption =  
PageInfo.encryptedKind::noEncryption,
```

```
bool isAbackupLocation = false,  
DatabaseLocation^ backupOfOrForLocation = nullptr  
)
```

F#

```
new :  
    inHost : string *  
    dir : string *  
    dbStartNum : uint32 *  
    dbEndNum : uint32 *  
    session : SessionBase *  
    compressPages : PageInfo.compressionKind *  
    ?pageEncryption : PageInfo.encryptionKind *  
    ?isAbackupLocation : bool *  
    ?backupOfOrForLocation : DatabaseLocation  
(* Defaults:  
    let_pageEncryption = defaultArg pageEncryption  
PageInfo.encryptionKind.noEncryption  
    let_isAbackupLocation = defaultArg isAbackupLocation false  
    let_backupOfOrForLocation = defaultArg backupOfOrForLocation null  
*)  
-> DatabaseLocation
```

Parameters

inHost

Type: [System.String](#)

Hostname of the computer with the DatabaseLocation directory.

dir

Type: [System.String](#)

The full path of the directory

dbStartNum

Type: [System.UInt32](#)

The first Database Id number for this location

dbEndNum

Type: [System.UInt32](#)

The last Database Id number for this location.

session

Type: [VelocityDb.Session.SessionBase](#)

The active session used for creating the location.

compressPages

Type: [VelocityDb.PageInfo.compressionKind](#)

Compress Database pages in this location?

pageEncryption (Optional)

Type: [VelocityDb.PageInfo.encryptionKind](#)

VelocityDB Class Library

Specify what kind of Page encryption to use (if any)

isAbackupLocation (Optional)

Type: [System.Boolean](#)

Is this location a backup location for another location?

backupOfOrForLocation (Optional)

Type: [VelocityDb.DatabaseLocation](#)

The other location being backed up or the location contain the backups

DatabaseLocation.DatabaseLocation Properties

The [DatabaseLocation](#) type exposes the following members.

Properties

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|  BackupOfOrForLocation | Gets a linked DatabaseLocation that is either backup of location or is the location being backup up which is decided by IsBackupLocation |
|  Cache | We do want to cache this kind of object since they are likely to be frequently used. (Overrides OptimizedPersistable.Cache.) |
|  CompressPages | Gets page compression info |
|  DesKey | Gets the Des encryption key from a .des file in user Documents folder. (Environment.SpecialFolder.MyDocuments) |
|  DirectoryPath | Gets the full path to the directory hosting databases |
|  EndDatabaseNumber | Gets or sets the last database number within the range of databases for this location |
|  HostName | Gets the host name of this database location |
|  IsBackupLocation | Tells if this is a location used for backing up databases. |
|  IsDefaultLocation | Is this the default DatabaseLocation where Database 0, 1, 2, 3, 4 may be stored? |
|  IsLocal | Gets info about this location being on the local host or not. |
|  PageEncryption | Gets the encryption kind attribute. |
|  PlacementDatabaseNumber | Hint about where to persist DatabaseLocation (Overrides OptimizedPersistable.PlacementDatabaseNumber.) |
|  Replicas | |
|  RsaPrivateXmlKey | The rsaPrivateXmlKey data field is not persisted but can be set and read with this property |
|  RsaPublicXmlKey | The rsaPublicXmlKey data field is not persisted but can be set and read with this property |
|  RsaSignature | The rsaSignature data field is not persisted but can be set and read with this property |
|  StartDatabaseNumber | Gets and sets the start of the range of Database numbers for this location. |

[VelocityDb Namespace](#)

DatabaseLocation.AllowOtherTypesOnSamePage Property

Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool AllowOtherTypesOnSamePage { get; }
```

VB

```
Public Overrides ReadOnly Property AllowOtherTypesOnSamePage As Boolean  
    Get
```

C++

```
public:  
virtual property bool AllowOtherTypesOnSamePage {  
    bool get () override;  
}
```

F#

```
abstract AllowOtherTypesOnSamePage : bool with get  
override AllowOtherTypesOnSamePage : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.AllowOtherTypesOnSamePage](#)

See Also

[DatabaseLocation Class](#)

DatabaseLocation.BackupOfOrForLocation Property

Gets a linked DatabaseLocation that is either backup of location or is the location being backup up which is decided by [IsBackupLocation](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DatabaseLocation BackupOfOrForLocation { get; set; }
```

VB

```
Public Property BackupOfOrForLocation As DatabaseLocation  
    Get  
    Set
```

C++

```
public:  
property DatabaseLocation^ BackupOfOrForLocation {  
    DatabaseLocation^ get ();  
    void set (DatabaseLocation^ value);  
}
```

F#

```
member BackupOfOrForLocation : DatabaseLocation with get, set
```

Property Value

Type: [DatabaseLocation](#)

See Also

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation.Cache Property

We do want to cache this kind of object since they are likely to be frequently used.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override CacheEnum Cache { get; }
```

VB

```
Public Overrides ReadOnly Property Cache As CacheEnum  
    Get
```

C++

```
public:  
virtual property CacheEnum Cache {  
    CacheEnum get () override;  
}
```

F#

```
abstract Cache : CacheEnum with get  
override Cache : CacheEnum with get
```

Property Value

Type: [CacheEnum](#)

Implements

[IOptimizedPersistable.Cache](#)

See Also

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation.CompressPages Property

Gets page compression info

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public PageInfo.compressionKind CompressPages { get; set; }
```

VB

```
Public Property CompressPages As PageInfo.compressionKind  
    Get  
    Set
```

C++

```
public:  
property PageInfo.compressionKind CompressPages {  
    PageInfo.compressionKind get ();  
    void set (PageInfo.compressionKind value);  
}
```

F#

```
member CompressPages : PageInfo.compressionKind with get, set
```

Return Value

Type: [PageInfo.compressionKind](#)

true if the databases in this location uses compression; otherwise, false.

DatabaseLocation.DesKey Property

Gets the Des encryption key from a .des file in user Documents folder.
(Environment.SpecialFolder.MyDocuments)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public byte[] DesKey { get; set; }
```

VB

```
Public Property DesKey As Byte ()  
    Get  
    Set
```

C++

```
public:  
property array<unsigned char>^ DesKey {  
    array<unsigned char>^ get ();  
    void set (array<unsigned char>^ value);  
}
```

F#

```
member DesKey : byte[] with get, set
```

Property Value

Type: [Byte\[\]](#)

See Also

DatabaseLocation.DirectoryPath Property

Gets the full path to the directory hosting databases

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string DirectoryPath { get; }
```

VB

```
Public ReadOnly Property DirectoryPath As String  
    Get
```

C++

```
public:  
property String^ DirectoryPath {  
    String^ get ();  
}
```

F#

```
member DirectoryPath : string with get
```

Property Value

Type: [String](#)

The path as a string

See Also

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation.EndDatabaseNumber Property

Gets or sets the last database number within the range of databases for this location

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint EndDatabaseNumber { get; set; }
```

VB

```
Public Property EndDatabaseNumber As UInteger  
    Get  
    Set
```

C++

```
public:  
property unsigned int EndDatabaseNumber {  
    unsigned int get ();  
    void set (unsigned int value);  
}
```

F#

```
member EndDatabaseNumber : uint32 with get, set
```

Property Value

Type: [UInt32](#)

The last database number within the range of databases for this location

See Also

DatabaseLocation.HostName Property

Gets the host name of this database location

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string HostName { get; }
```

VB

```
Public ReadOnly Property HostName As String  
    Get
```

C++

```
public:  
property String^ HostName {  
    String^ get ();  
}
```

F#

```
member HostName : string with get
```

Property Value

Type: [String](#)

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation.IsBackupLocation Property

Tells if this is a location used for backing up databases.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool IsBackupLocation { get; set; }
```

VB

```
Public Property IsBackupLocation As Boolean  
    Get  
    Set
```

C++

```
public:  
property bool IsBackupLocation {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
member IsBackupLocation : bool with get, set
```

Property Value

Type: [Boolean](#)

true if it is this location is used for backups; otherwise false.

DatabaseLocation.IsLocal Property

Gets info about this location being on the local host or not.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool IsLocal { get; }
```

VB

```
Public ReadOnly Property IsLocal As Boolean  
    Get
```

C++

```
public:  
property bool IsLocal {  
    bool get ();  
}
```

F#

```
member IsLocal : bool with get
```

Return Value

Type: [Boolean](#)

true if the location is located on the local host; otherwise, false.

DatabaseLocation.StartDatabaseNumber Property

Gets and sets the start of the range of [Database](#) numbers for this location.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint StartDatabaseNumber { get; set; }
```

VB

```
Public Property StartDatabaseNumber As UInteger  
    Get  
    Set
```

C++

```
public:  
property unsigned int StartDatabaseNumber {  
    unsigned int get ();  
    void set (unsigned int value);  
}
```

F#

```
member StartDatabaseNumber : uint32 with get, set
```

Property Value

Type: [UInt32](#)

The first database number within the range of databases for this location

DatabaseLocation.DatabaseLocation Methods

The [DatabaseLocation](#) type exposes the following members.

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  CompareTo | The default compare of two DatabaseLocation is by host name and directory (Overrides OptimizedPersistable.CompareTo(Object).) |
|  ContainsDatabase | Check if this location contains a particular Database |
|  ContainsNewDatabase | Check if this location contains a particular new database (not yet committed) Database |
|  DatabasePath | Get the full path to a Database |
|  Databases | Enumerates all Databases of this location |
|  InitializeAfterRead | Sets the desKey field for desEncrypted locations by reading .des file in Environment.SpecialFolder.MyDocuments (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase).) |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  Persist | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. (Overrides OptimizedPersistable.Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)).) |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

DatabaseLocation.CompareTo Method

The default compare of two DatabaseLocation is by host name and directory

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override int CompareTo(  
    Object obj  
)
```

VB

```
Public Overrides Function CompareTo (  
    obj As Object  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    Object^ obj  
) override
```

F#

```
abstract CompareTo :  
    obj : Object -> int  
override CompareTo :  
    obj : Object -> int
```

Parameters

obj

Type: [System.Object](#)

The location to compare with

Return Value

Type: [Int32](#)

-1 if this location is less than the other, 0 if equal, otherwise 1

Implements

[IComparable.CompareTo\(Object\)](#)

[IComparable.CompareTo\(Object\)](#)

DatabaseLocation.ContainsDatabase Method

Check if this location contains a particular [Database](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool ContainsDatabase(  
    uint dbNum,  
    string extension = ".odb"  
)
```

VB

```
Public Function ContainsDatabase (  
    dbNum As UInteger,  
    Optional extension As String = ".odb"  
) As Boolean
```

C++

```
public:  
bool ContainsDatabase(  
    unsigned int dbNum,  
    String^ extension = L".odb"  
)
```

F#

```
member ContainsDatabase :  
    dbNum : uint32 *  
    ?extension : string  
(* Defaults:  
    let _extension = defaultArg extension ".odb"  
)  
-> bool
```

Parameters

dbNum

Type: [System.UInt32](#)

The database number to look for

extension (Optional)

Type: [System.String](#)

File name extension/id

Return Value

Type: [Boolean](#)

`true` if the location contains this database; otherwise, `false`.

[VelocityDb Namespace](#)

DatabaseLocation.ContainsNewDatabase Method

Check if this location contains a particular new database (not yet committed) [Database](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool ContainsNewDatabase(  
    uint dbNum  
)
```

VB

```
Public Function ContainsNewDatabase (  
    dbNum As UInteger  
) As Boolean
```

C++

```
public:  
bool ContainsNewDatabase(  
    unsigned int dbNum  
)
```

F#

```
member ContainsNewDatabase :  
    dbNum : uint32 -> bool
```

Parameters

dbNum

Type: [System.UInt32](#)

The database number to look for

Return Value

Type: [Boolean](#)

true if the location contains this new uncommitted database; otherwise, false.

DatabaseLocation.DatabasePath Method

Get the full path to a [Database](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string DatabasePath(  
    uint dbNum  
)
```

VB

```
Public Function DatabasePath (  
    dbNum As UInteger  
) As String
```

C++

```
public:  
String^ DatabasePath(  
    unsigned int dbNum  
)
```

F#

```
member DatabasePath :  
    dbNum : uint32 -> string
```

Parameters

dbNum

Type: [System.UInt32](#)

The database number to look for

Return Value

Type: [String](#)

A [String](#) containing the full [Database](#) path.

DatabaseLocation.InitializeAfterRead Method

Sets the desKey field for desEncrypted locations by reading .des file in Environment.SpecialFolder.MyDocuments

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRead(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRead (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRead(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRead :  
    session : SessionBase -> unit  
override InitializeAfterRead :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

Implements

[IOptimizedPersistable.InitializeAfterRead\(SessionBase\)](#)

See Also

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation.InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRecreate(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
public:

) override
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit  
override InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRecreate\(SessionBase\)](#)

See Also

[DatabaseLocation Class](#)

[VelocityDb Namespace](#)

DatabaseLocation.Persist Method

Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ulong Persist(
    Placement place,
    SessionBase session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable> toPersist = null
)
```

VB

```
Public Overrides Function Persist (
    place As Placement,
    session As SessionBase,
    Optional persistRefs As Boolean = true,
    Optional disableFlush As Boolean = false,
    Optional toPersist As Queue(Of IOptimizedPersistable) = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    Placement^ place,
    SessionBase^ session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable^>^ toPersist = nullptr
) override
```

F#

```
abstract Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let _persistRefs = defaultArg persistRefs true
    let _disableFlush = defaultArg disableFlush false
    let _toPersist = defaultArg toPersist null
*)
-> uint64
override Persist :
```

```
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

The placement rules to follow when persisting this object

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

persistRefs (Optional)

Type: [System.Boolean](#)

If true, objects referenced from this object will also be persisted

disableFlush (Optional)

Type: [System.Boolean](#)

If true, disables possible flushing of updated pages while persisting this object; otherwise page flushing may occur

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A queue of objects remaining to be persisted. Pass as a parameter to session.Persist

Return Value

Type: [UInt64](#)

The object id of this persistent object

Implements

[IOptimizedPersistable.Persist\(Placement, SessionBase, Boolean, Boolean, Queue<IOptimizedPersistable>\)](#)

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.DatabaseLocations

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

| C# |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>[SerializableAttribute] public class DatabaseLocations : OptimizedPersistable, IEnumerable<DatabaseLocation>, IEnumerable</pre> |
| VB |
| <pre><SerializableAttribute> Public Class DatabaseLocations Inherits OptimizedPersistable Implements IEnumerable(Of DatabaseLocation), IEnumerable</pre> |
| C++ |
| <pre>[SerializableAttribute] public ref class DatabaseLocations : public OptimizedPersistable, IEnumerable<DatabaseLocation^>, IEnumerable</pre> |
| F# |
| <pre>[<SerializableAttribute>] type DatabaseLocations = class inherit OptimizedPersistable interface IEnumerable<DatabaseLocation> interface IEnumerable end</pre> |

The **DatabaseLocations** type exposes the following members.

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other |

| | |
|--|-------------------------------------------------------------------------------------|
| | types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|--|-------------------------------------------------------------------------------------|

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Default | Returns the DatabaseLocation of the startup/system Databases. |
|  GetEnumerator | Enumerates all DatabaseLocations |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  LocateDb | Returns the DatabaseLocation for which a Database exists in. |
|  LocationForDb | Returns the DatabaseLocation for which a Database belongs to. |
|  ReadMe | Used by code generator (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

The version of the type being read

memberBytes

Type: [System.Byte\[\]](#)

offset

Type: [System.Int32](#)

session

Type: [VelocityDb.Session.SessionBase](#)

page

Type: [VelocityDb.Page](#)

useOidShort

Type: [System.Boolean](#)

schema

Type: [VelocityDb.TypeInfo.Schema](#)

VelocityDB Class Library

openRefs

Type: [System.Boolean](#)

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

graphDepth

Type: [System.Int32](#)

graphDepthToLoad

Type: [System.Int32](#)

primitivesOnly

Type: [System.Boolean](#)

Implements

[IOptimizedPersistable.ReadMe\(TypeVersion,Byte\[\], Int32, SessionBase, Page, Boolean, Schema, Boolean, List<IOptimizedPersistable>, Int32, Int32, Boolean\)](#)

See Also

[DatabaseLocations Class](#)

[VelocityDb Namespace](#)

DataCache Class

Object maintains a list of pages accessed by a session, pages are removed from the list when there is not enough memory available. This makes such pages eligible for garbage collection while in list pages are prevented from being garbage collected.

Inheritance Hierarchy

[System.Object](#)

VelocityDb.DataCache

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#
public class DataCache
```

```
VB
Public Class DataCache
```

```
C++
public ref class DataCache
```

```
F#
type DataCache = class end
```

The **DataCache** type exposes the following members.

Properties

| | Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
|   | AvailableRamMB | Current available memory in MB as calculated by using PerformanceCounter or current use relative to MaximumMemoryUse |
|   | MaximumMemoryUse | Maximum number of bytes to allow for this Process (reduces cached objects and pages when memory allocated reaches this soft limit) |
|   | MemoryUsedByThisProcess | The amount of virtual memory, in bytes, allocated for this process. |
|  | MinimumAvailableMegaBytes | Decide the minimum amount of available memory before reducing page caching and flushing updated pages. Only used by 32-bit process. |

VelocityDB Class Library

| | | |
|-----------------------------------------------------------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | PageCacheEnabled | Enable or disable page cache. In cases where pages are not going to be revisited, performance may be improved by disabling the page cache. In other cases leave the page cache enabled (the default) |
|-----------------------------------------------------------------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------|-----------------------------|
|  | Clear | Clear cache of cached pages |

Fields

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|-------------|
|  | s_computerInfo | |

DataCache.AvailableRamMB Property

Current available memory in MB as calculated by using PerformanceCounter or current use relative to MaximumMemoryUse

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static uint AvailableRamMB { get; }
```

VB

```
Public Shared ReadOnly Property AvailableRamMB As UInteger  
    Get
```

C++

```
public:  
static property unsigned int AvailableRamMB {  
    unsigned int get ();  
}
```

F#

```
static member AvailableRamMB : uint32 with get
```

Property Value

Type: [UInt32](#)

See Also

DataCache.MaximumMemoryUse Property

Maximum number of bytes to allow for this Process (reduces cached objects and pages when memory allocated reaches this soft limit)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static long MaximumMemoryUse { get; set; }
```

VB

```
Public Shared Property MaximumMemoryUse As Long  
    Get  
    Set
```

C++

```
public:  
static property long long MaximumMemoryUse {  
    long long get ();  
    void set (long long value);  
}
```

F#

```
static member MaximumMemoryUse : int64 with get, set
```

Property Value

Type: [Int64](#)

IOptimizedPersistable Interface

add optimized persistence by implementing this interface. We provide [OptimizedPersistable](#) as a base class that implements this interface.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public interface IOptimizedPersistable : IComparable
```

VB

```
Public Interface IOptimizedPersistable
    Inherits IComparable
```

C++

```
public interface class IOptimizedPersistable : IComparable
```

F#

```
type IOptimizedPersistable =
    interface
        interface IComparable
    end
```

The **IOptimizedPersistable** type exposes the following members.

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | By default true but override as returning false so that this type of objects isn't sharing pages with other type of objects. |
|  Cache | By default, the an object cache is determined by a SessionBase constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do. |
|  FieldsLoaded | Gets the field members load state. By default, all members are loaded when a persistent object is opened but if an override of LazyLoadFields returns true then the object members are loaded by calling [!:OptimizedPersistable.LoadFields] |

| | |
|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  FlushIfPageFull | By default we flush (write) any updated page we find when looking for an object placement page and the page is considered full (depends on how many objects we permit/page) |
|  Id | Gets the id of this object. The id is structured as Oid |
|  IsPersistent | Gets the persistent state of an object. An object is considered persistent when it has an Oid , that is the Id is not 0 |
|  IsUpdated | Gets the updated state of the object |
|  LazyLoadFields | By default all fields are loaded when opening a persistent object but an option is provided to load members on demand (lazy loading). |
|  MaxNumberOfDatabases | Possibly restrict instances of to a single Database. By default this property is UInt32.MaxValue but classes like BTreeSetOidShort, BTreeMapShortOid ... override this property to return 1 since short references are restricted to a single Database. |
|  ObjectsPerPage | A default for number of objects per database page used when persisting objects without an explicit Placement object or if persisted using Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent. |
|  PagesPerDatabase | A default for number of objects per database page used when persisting objects without an explicit Placement object or if persisting using Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent. |
|  PlacementDatabaseNumber | Gets the Database Id number to use when placing (persisting) an instance of this class when no other placement directive has been given. |
|  RemovedFromIndices | <code>true</code> if call to [!:Update(bool)] or UpdateObject(IOptimizedPersistable, Boolean, Boolean) caused this object to be removed from possible indices |

Methods

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
|  FlushTransients | Flushes batched up objects such as objects added with AddFast(Key) |
|  GetPage | Get the persistent storage Page of this object |
|  GetTypeVersion | The database engine needs this internally |
|  GetWrappedObject | Internally used when IOptimizedPersistable is a wrapper for a non IOptimizedPersistable |

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  InitializeAfterRead | This function is called when an object has been read from disk and all data members (fields) have been loaded. Override this to provide your own initializations of transient data. |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. |
|  Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) | Persists this object. |
|  Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) | Persists this object. |
|  PersistMyReferences | Persists references from this object |
|  ReadMe | Provides a way to customize how an object is read. Used by a code generator |
|  SetPage | Sets the persistent storage Page of this object |
|  SetTypeVersion | The database engine needs this internally |
|  ShallowCopyTo | Copies current object to a page |
|  Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. |
|  Update | Call this function before updating any fields of this object |
|  WriteMe | Provides a way to customize how an object is written. Used by a code generator |

IOptimizedPersistable.PagesPerDatabase Property

A default for number of objects per database page used when persisting objects without an explicit [Placement](#) object or if persisting using [Persist\(SessionBase, IOptimizedPersistable, Boolean, Boolean\)](#). This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
ushort PagesPerDatabase { get; }
```

VB

```
ReadOnly Property PagesPerDatabase As UShort  
    Get
```

C++

```
property unsigned short PagesPerDatabase {  
    unsigned short get ();  
}
```

F#

```
abstract PagesPerDatabase : uint16 with get
```

Return Value

Type: [UInt16](#)

The requested number of pages per database

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.PlacementDatabaseNumber Property

Gets the Database Id number to use when placing (persisting) an instance of this class when no other placement directive has been given.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
uint PlacementDatabaseNumber { get; }
```

VB

```
ReadOnly Property PlacementDatabaseNumber As UInteger  
    Get
```

C++

```
property unsigned int PlacementDatabaseNumber {  
    unsigned int get ();  
}
```

F#

```
abstract PlacementDatabaseNumber : uint32 with get
```

Property Value

Type: [UInt32](#)

See Also

[IOptimizedPersistable Interface](#)

IOptimizedPersistable.RemovedFromIndices Property

true

if call to **[!:Update(bool)]** or [UpdateObject\(IOptimizedPersistable, Boolean, Boolean\)](#) caused this object to be removed from possible indices

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
bool RemovedFromIndices { get; set; }
```

VB

```
Property RemovedFromIndices As Boolean  
    Get  
    Set
```

C++

```
property bool RemovedFromIndices {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
abstract RemovedFromIndices : bool with get, set
```

Property Value

Type: [Boolean](#)

IOptimizedPersistable.IOptimizedPersistable Methods

The [IOptimizedPersistable](#) type exposes the following members.

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FlushTransients | Flushes batched up objects such as objects added with AddFast(Key) |
| GetPage | Get the persistent storage Page of this object |
| GetTypeVersion | The database engine needs this internally |
| GetWrappedObject | Internally used when IOptimizedPersistable is a wrapper for a non IOptimizedPersistable |
| InitializeAfterRead | This function is called when an object has been read from disk and all data members (fields) have been loaded. Override this to provide your own initializations of transient data. |
| InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. |
| Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) | Persists this object. |
| Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) | Persists this object. |
| PersistMyReferences | Persists references from this object |
| ReadMe | Provides a way to customize how an object is read. Used by a code generator |
| SetPage | Sets the persistent storage Page of this object |
| SetTypeVersion | The database engine needs this internally |
| ShallowCopyTo | Copies current object to a page |
| Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. |
| Update | Call this function before updating any fields of this object |
| WriteMe | Provides a way to customize how an object is written. Used by a code generator |

IOptimizedPersistable.InitializeAfterRead Method

This function is called when an object has been read from disk and all data members (fields) have been loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void InitializeAfterRead(  
    SessionBase session  
)
```

VB

```
Sub InitializeAfterRead (  
    session As SessionBase  
)
```

C++

```
void InitializeAfterRead(  
    SessionBase^ session  
)
```

F#

```
abstract InitializeAfterRead :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void InitializeAfterRecreate (  
    SessionBase session  
)
```

VB

```
Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
void InitializeAfterRecreate (  
    SessionBase^ session  
)
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.Persist Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|-----------------------|
|  | Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) | Persists this object. |
|  | Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) | Persists this object. |

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.Persist Method (SessionBase, IOptimizedPersistable, Boolean, Boolean)

Persists this object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
ulong Persist(  
    SessionBase session,  
    IOptimizedPersistable placeHint,  
    bool persistRefs = true,  
    bool disableFlush = false  
)
```

VB

```
Function Persist (  
    session As SessionBase,  
    placeHint As IOptimizedPersistable,  
    Optional persistRefs As Boolean = true,  
    Optional disableFlush As Boolean = false  
) As ULong
```

C++

```
unsigned long long Persist(  
    SessionBase^ session,  
    IOptimizedPersistable^ placeHint,  
    bool persistRefs = true,  
    bool disableFlush = false  
)
```

F#

```
abstract Persist :  
    session : SessionBase *  
    placeHint : IOptimizedPersistable *  
    ?persistRefs : bool *  
    ?disableFlush : bool  
(* Defaults:  
    let _persistRefs = defaultArg persistRefs true  
    let _disableFlush = defaultArg disableFlush false  
*)  
-> uint64
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

placeHint

Type: [VelocityDb.IOptimizedPersistable](#)

Use placement as specified by this object type, see [PlacementDatabaseNumber](#), [ObjectsPerPage](#) and [PagesPerDatabase](#)

persistRefs (Optional)

Type: [System.Boolean](#)

Persist any referenced object now or delay until flush/commit

disableFlush (Optional)

Type: [System.Boolean](#)

Controls possible flushing of updated pages. Set to true if you want to prevent updated pages from being flushed to disk and setting such pages to a non updated state.

Return Value

Type: [UInt64](#)

The object id of the persistent object

See Also

[IOptimizedPersistable Interface](#)

[Persist Overload](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.Persist Method (Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable))

Persists this object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
ulong Persist(
    Placement place,
    SessionBase session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable> toPersist = null
)
```

VB

```
Function Persist (
    place As Placement,
    session As SessionBase,
    Optional persistRefs As Boolean = true,
    Optional disableFlush As Boolean = false,
    Optional toPersist As Queue(Of IOptimizedPersistable) = Nothing
) As ULong
```

C++

```
unsigned long long Persist(
    Placement^ place,
    SessionBase^ session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable^>^ toPersist = nullptr
)
```

F#

```
abstract Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

The placement rules to follow when persisting this object

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

persistRefs (Optional)

Type: [System.Boolean](#)

If true, objects referenced from this object will also be persisted

disableFlush (Optional)

Type: [System.Boolean](#)

If true, disables possible flushing of updated pages while persisting this object; otherwise page flushing may occur

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A queue of objects remaining to be persisted. Pass as a parameter to session.Persist

Return Value

Type: [UInt64](#)

The object id of the persistent object

See Also

[IOptimizedPersistable Interface](#)

[Persist Overload](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.PersistMyReferences Method

Persists references from this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void PersistMyReferences (
    SessionBase session,
    bool inFlush
)
```

VB

```
Sub PersistMyReferences (
    session As SessionBase,
    inFlush As Boolean
)
```

C++

```
void PersistMyReferences (
    SessionBase^ session,
    bool inFlush
)
```

F#

```
abstract PersistMyReferences :
    session : SessionBase *
    inFlush : bool -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

inFlush

Type: [System.Boolean](#)

are we in a page flush

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.ReadMe Method

Provides a way to customize how an object is read. Used by a code generator

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void ReadMe (
    TypeVersion typeVersion,
    byte[] memberBytes,
    ref int offset,
    SessionBase session,
    Page page,
    bool useOidShort,
    Schema schema,
    bool openRefs,
    List<IOptimizedPersistable> toLoadMembers,
    int graphDepth,
    int graphDepthToLoad,
    bool primitivesOnly
)
```

VB

```
Sub ReadMe (
    typeVersion As TypeVersion,
    memberBytes As Byte(),
    ByRef offset As Integer,
    session As SessionBase,
    page As Page,
    useOidShort As Boolean,
    schema As Schema,
    openRefs As Boolean,
    toLoadMembers As List(Of IOptimizedPersistable),
    graphDepth As Integer,
    graphDepthToLoad As Integer,
    primitivesOnly As Boolean
)
```

C++

```
void ReadMe (
    TypeVersion^ typeVersion,
    array<unsigned char>^ memberBytes,
    int% offset,
    SessionBase^ session,
    Page^ page,
    bool useOidShort,
    Schema^ schema,
    bool openRefs,
    List<IOptimizedPersistable^>^ toLoadMembers,
    int graphDepth,
```

```
    int graphDepthToLoad,  
    bool primitivesOnly  
)
```

F#

```
abstract ReadMe :  
    typeVersion : TypeVersion *  
    memberBytes : byte[] *  
    offset : int byref *  
    session : SessionBase *  
    page : Page *  
    useOidShort : bool *  
    schema : Schema *  
    openRefs : bool *  
    toLoadMembers : List<IOptimizedPersistable> *  
    graphDepth : int *  
    graphDepthToLoad : int *  
    primitivesOnly : bool -> unit
```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

the type version of the object being read

memberBytes

Type: [System.Byte\[\]](#)

the raw bytes to read the object from

offset

Type: [System.Int32](#)

current offset into the raw object bytes

session

Type: [VelocityDb.Session.SessionBase](#)

the active session

page

Type: [VelocityDb.Page](#)

the page of the object

useOidShort

Type: [System.Boolean](#)

is object using short references

schema

Type: [VelocityDb.TypeInfo.Schema](#)

the active schema

openRefs

VelocityDB Class Library

Type: [System.Boolean](#)

open references objects

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

a list of field members to load

graphDepth

Type: [System.Int32](#)

current depth in object read

graphDepthToLoad

Type: [System.Int32](#)

requested max object depth to read

primitivesOnly

Type: [System.Boolean](#)

if true, only load primitive members (not referenced objects)

See Also

[VelocityDb Namespace](#)

IOptimizedPersistable.SetPage Method

Sets the persistent storage [Page](#) of this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void SetPage (  
    Page page  
)
```

VB

```
Sub SetPage (  
    page As Page  
)
```

C++

```
void SetPage (  
    Page^ page  
)
```

F#

```
abstract SetPage :  
    page : Page -> unit
```

Parameters

page

Type: [VelocityDb.Page](#)

A persistent storage [Page](#)

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.SetTypeVersion Method

The database engine needs this internally

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void SetTypeVersion(  
    TypeVersion shape  
)
```

VB

```
Sub SetTypeVersion (  
    shape As TypeVersion  
)
```

C++

```
void SetTypeVersion(  
    TypeVersion^ shape  
)
```

F#

```
abstract SetTypeVersion :  
    shape : TypeVersion -> unit
```

Parameters

shape

Type: [VelocityDb.TypeInfo.TypeVersion](#)

The [TypeVersion](#) to use for this object

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.ShallowCopyTo Method

Copies current object to a page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
IOptimizedPersistable ShallowCopyTo(  
    Page page  
)
```

```
VB  
Function ShallowCopyTo (  
    page As Page  
) As IOptimizedPersistable
```

```
C++  
IOptimizedPersistable^ ShallowCopyTo(  
    Page^ page  
)
```

```
F#  
abstract ShallowCopyTo :  
    page : Page -> IOptimizedPersistable
```

Parameters

page

Type: [VelocityDb.Page](#)

The page to copy to

Return Value

Type: [IOptimizedPersistable](#)

Id of object copy

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
void Unpersist (  
    SessionBase session  
)
```

VB

```
Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
void Unpersist (  
    SessionBase^ session  
)
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.Update Method

Call this function before updating any fields of this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
bool Update ()
```

VB

```
Function Update As Boolean
```

C++

```
bool Update ()
```

F#

```
abstract Update : unit -> bool
```

Return Value

Type: [Boolean](#)

true if update was successful; otherwise false

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IOptimizedPersistable.WriteMe Method

Provides a way to customize how an object is written. Used by a code generator

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
byte[] WriteMe(  
    TypeVersion typeVersion,  
    bool addShapeNumber,  
    PageInfo pageInfo,  
    IOptimizedPersistable owner,  
    SessionBase session,  
    bool inFlush  
)
```

VB

```
Function WriteMe (  
    typeVersion As TypeVersion,  
    addShapeNumber As Boolean,  
    pageInfo As PageInfo,  
    owner As IOptimizedPersistable,  
    session As SessionBase,  
    inFlush As Boolean  
) As Byte ()
```

C++

```
array<unsigned char>^ WriteMe(  
    TypeVersion^ typeVersion,  
    bool addShapeNumber,  
    PageInfo^ pageInfo,  
    IOptimizedPersistable^ owner,  
    SessionBase^ session,  
    bool inFlush  
)
```

F#

```
abstract WriteMe :  
    typeVersion : TypeVersion *  
    addShapeNumber : bool *  
    pageInfo : PageInfo *  
    owner : IOptimizedPersistable *  
    session : SessionBase *  
    inFlush : bool -> byte[]
```

Parameters

typeVersion

VelocityDB Class Library

Type: [VelocityDb.TypeInfo.TypeVersion](#)

the type version of the object being written

addShapeNumber

Type: [System.Boolean](#)

add type version number to object bytes

pageInfo

Type: [VelocityDb.PageInfo](#)

the page info for the page to written to

owner

Type: [VelocityDb.IOptimizedPersistable](#)

owning object

session

Type: [VelocityDb.Session.SessionBase](#)

the active session

inFlush

Type: [System.Boolean](#)

are we in a page flush

Return Value

Type: [Byte\[\]](#)

Bytes representing this object

See Also

[IOptimizedPersistable Interface](#)

[VelocityDb Namespace](#)

IReferenceTracked Interface

Maintains a set of all [References](#) to this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public interface IReferenceTracked : IOptimizedPersistable,  
    IComparable
```

VB

```
Public Interface IReferenceTracked  
    Inherits IOptimizedPersistable, IComparable
```

C++

```
public interface class IReferenceTracked : IOptimizedPersistable,  
    IComparable
```

F#

```
type IReferenceTracked =  
    interface  
        interface IOptimizedPersistable  
        interface IComparable  
    end
```

The **IReferenceTracked** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|-----------------------------------------------|
|  | References | Get a collection of references to this object |

See Also

[VelocityDb Namespace](#)

IReferenceTracked.IReferenceTracked Properties

The [IReferenceTracked](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|-----------------------------------------------|
|  | References | Get a collection of references to this object |

See Also

[IReferenceTracked Interface](#)

[VelocityDb Namespace](#)

IReferenceTracked.References Property

Get a collection of references to this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
BTreeSet<Reference> References { get; }
```

VB

```
ReadOnly Property References As BTreeSet (Of Reference)  
Get
```

C++

```
property BTreeSet<Reference^>^ References {  
    BTreeSet<Reference^>^ get ();  
}
```

F#

```
abstract References : BTreeSet<Reference> with get
```

Property Value

Type: [BTreeSet\(Reference\)](#)

License Class

Contains a list of possible license attributes for licensing VelocityDb class library and server

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.License

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class License : OptimizedPersistable
```

VB

```
<SerializableAttribute>
Public Class License
    Inherits OptimizedPersistable
```

C++

```
[SerializableAttribute]
public ref class License : public OptimizedPersistable
```

F#

```
[<SerializableAttribute>]
type License =
    class
        inherit OptimizedPersistable
    end
```

The **License** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------------|---------------------------------------------------------------------|
|  | DateTimeCreated | Gets the time of license creation. |
|  | DomainName | Gets the restricted domain name |
|  | ExpireDate | Gets expire time. |
|  | HostName | Gets the restricted host name |
|  | MajorVersion | Gets/set the major version attribute of a license |
|  | MaxNumberOfClients | Gets the maximum number of Server clients permitted by this license |

| | |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|  MinorVersion | Gets/set the minor version attribute of a license |
|  ObjectsPerPage | Store one License per Page (Overrides OptimizedPersistable.ObjectsPerPage.) |
|  PlacementDatabaseNumber | Gets the preferred Database number for licenses (Overrides OptimizedPersistable.PlacementDatabaseNumber.) |
|  ProcessorCount | Gets/sets maximum number of processors for which license is valid. |
|  UserName | Gets the user name restriction |

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  WriteMe | (Overrides OptimizedPersistable.WriteMe(TypeVersion, Boolean, PageInfo, IOptimizedPersistable, SessionBase, Boolean).) |

Fields

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
|  LicenseCheckDatabase | The Database number of the database containing a VelocityDb license(s) |
|  PlaceInDatabase | Hint about a Database location for this type of object. |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

License.License Properties

The [License](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
|  | DateTimeCreated | Gets the time of license creation. |
|  | DomainName | Gets the restricted domain name |
|  | ExpireDate | Gets expire time. |
|  | HostName | Gets the restricted host name |
|  | MajorVersion | Gets/set the major version attribute of a license |
|  | MaxNumberOfClients | Gets the maximum number of Server clients permitted by this license |
|  | MinorVersion | Gets/set the minor version attribute of a license |
|  | ObjectsPerPage | Store one License per Page (Overrides OptimizedPersistable.ObjectsPerPage.) |
|  | PlacementDatabaseNumber | Gets the preferred Database number for licenses (Overrides OptimizedPersistable.PlacementDatabaseNumber.) |
|  | ProcessorCount | Gets/sets maximum number of processors for which license is valid. |
|  | UserName | Gets the user name restriction |

License.DateTimeCreated Property

Gets the time of license creation.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DateTime DateTimeCreated { get; }
```

VB

```
Public ReadOnly Property DateTimeCreated As DateTime  
    Get
```

C++

```
public:  
property DateTime DateTimeCreated {  
    DateTime get ();  
}
```

F#

```
member DateTimeCreated : DateTime with get
```

Property Value

Type: [DateTime](#)

[VelocityDb Namespace](#)

License.DomainName Property

Gets the restricted domain name

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string DomainName { get; set; }
```

VB

```
Public Property DomainName As String  
    Get  
    Set
```

C++

```
public:  
property String^ DomainName {  
    String^ get ();  
    void set (String^ value);  
}
```

F#

```
member DomainName : string with get, set
```

Property Value

Type: [String](#)

License.ExpireDate Property

Gets expire time.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DateTime ExpireDate { get; set; }
```

VB

```
Public Property ExpireDate As DateTime  
    Get  
    Set
```

C++

```
public:  
property DateTime ExpireDate {  
    DateTime get ();  
    void set (DateTime value);  
}
```

F#

```
member ExpireDate : DateTime with get, set
```

License.HostName Property

Gets the restricted host name

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string HostName { get; set; }
```

VB

```
Public Property HostName As String  
    Get  
    Set
```

C++

```
public:  
property String^ HostName {  
    String^ get ();  
    void set (String^ value);  
}
```

F#

```
member HostName : string with get, set
```

License.MajorVersion Property

Gets/set the major version attribute of a license

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int MajorVersion { get; set; }
```

VB

```
Public Property MajorVersion As Integer  
    Get  
    Set
```

C++

```
public:  
property int MajorVersion {  
    int get ();  
    void set (int value);  
}
```

F#

```
member MajorVersion : int with get, set
```

Property Value

Type: [Int32](#)

License.MaxNumberOfClients Property

Gets the maximum number of Server clients permitted by this license

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint MaxNumberOfClients { get; set; }
```

VB

```
Public Property MaxNumberOfClients As UInteger  
    Get  
    Set
```

C++

```
public:  
property unsigned int MaxNumberOfClients {  
    unsigned int get ();  
    void set (unsigned int value);  
}
```

F#

```
member MaxNumberOfClients : uint32 with get, set
```

Property Value

Type: [UInt32](#)

See Also

License.MinorVersion Property

Gets/set the minor version attribute of a license

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int MinorVersion { get; set; }
```

VB

```
Public Property MinorVersion As Integer  
    Get  
    Set
```

C++

```
public:  
property int MinorVersion {  
    int get ();  
    void set (int value);  
}
```

F#

```
member MinorVersion : int with get, set

License.ObjectsPerPage Property

Store one License per Page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ushort ObjectsPerPage { get; }
```

VB

```
Public Overrides ReadOnly Property ObjectsPerPage As UShort  
    Get
```

C++

```
public:  
virtual property unsigned short ObjectsPerPage {  
    unsigned short get () override;  
}
```

F#

```
abstract ObjectsPerPage : uint16 with get  
override ObjectsPerPage : uint16 with get
```

Return Value

Type: [UInt16](#)

Implements

[IOptimizedPersistable.ObjectsPerPage](#)

License.PlacementDatabaseNumber Property

Gets the preferred Database number for licenses

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override uint PlacementDatabaseNumber { get; }
```

VB

```
Public Overrides ReadOnly Property PlacementDatabaseNumber As UInteger  
    Get
```

C++

```
public:  
virtual property unsigned int PlacementDatabaseNumber {  
    unsigned int get () override;  
}
```

F#

```
abstract PlacementDatabaseNumber : uint32 with get  
override PlacementDatabaseNumber : uint32 with get
```

Property Value

Type: [UInt32](#)

Implements

[IOptimizedPersistable.PlacementDatabaseNumber](#)

OfType Class

An object of this type is a base class of type returned by [AllObjects\(T\)\(Boolean, Boolean\)](#) or [AllObjects\(T\)\(Boolean\)](#)

Inheritance Hierarchy

[System.Object](#)

VelocityDb.OfType

[VelocityDb.AllObjects\(T\)](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class OfType : IEnumerable
```

VB

```
Public Class OfType
    Implements IEnumerable
```

C++

```
public ref class OfType : IEnumerable
```

F#

```
type OfType =
    class
        interface IEnumerable
    end
```

The **OfType** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------|--------------------------------------------|
|  | OfType(Type, Database, Boolean) | Constructs this enumeration wrapper object |
|  | OfType(Type, SessionBase, Boolean, Boolean) | Constructs this enumeration wrapper object |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
|  | Count | Get a count of instances of the given type. This value is computed by a quick iteration over all objects of the requested type. |
|  | GetEnumerator | Enumeration of all objects of the selected Type |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
|  | ElementAt | Override LINQ for faster access (Defined by OfTypeExtension.) |
|  | Skip | Bypasses a specified number of elements in a sequence and then returns the remaining elements. (Defined by OfTypeExtension.) |

    Type type,  
    Database db,  
    bool includeSubClasses = false  
)
```

VB

```
Public Sub New (  
    type As Type,  
    db As Database,  
    Optional includeSubClasses As Boolean = false  
)
```

C++

```
public:  
OfType(  
    Type^ type,  
    Database^ db,  
    bool includeSubClasses = false  
)
```

F#

```
new :  
    type : Type *  
    db : Database *  
    ?includeSubClasses : bool  
(* Defaults:  
    let_includeSubClasses = defaultArg includeSubClasses false  
)  
-> OfType
```

Parameters

type

Type: [System.Type](#)

The [Type](#) to look for.

db

Type: [VelocityDb.Database](#)

The active db

VelocityDB Class Library

includeSubClasses (Optional)

Type: [System.Boolean](#)

Also return instances of sub classes

See Also

[OfType Class](#)

[OfType Overload](#)

[VelocityDb Namespace](#)

OfType Constructor (Type, SessionBase, Boolean, Boolean)

Constructs this enumeration wrapper object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public OfType(  
    Type type,  
    SessionBase session,  
    bool includeSubclasses,  
    bool databasePerType  
)
```

VB

```
Public Sub New (  
    type As Type,  
    session As SessionBase,  
    includeSubclasses As Boolean,  
    databasePerType As Boolean  
)
```

C++

```
public:  
OfType(  
    Type^ type,  
    SessionBase^ session,  
    bool includeSubclasses,  
    bool databasePerType  
)
```

F#

```
new :  
    type : Type *  
    session : SessionBase *  
    includeSubclasses : bool *  
    databasePerType : bool -> OfType
```

Parameters

type

Type: [System.Type](#)

The [Type](#) of persisted objects to enumerate

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

VelocityDB Class Library

includeSubclasses

Type: [System.Boolean](#)

Also return instances of sub classes

databasePerType

Type: [System.Boolean](#)

Assume that persisted objects where made persistent the simple way using

[Persist\(IOptimizedPersistable, Nullable\(UInt16\)\)](#). When persisting this way, each object type gets its own [Database](#) which makes finding these objects easier and faster

[OfType Class](#)

[OfType Overload](#)

[VelocityDb Namespace](#)

OfType.OfType Methods

The [OfType](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
|  | Count | Get a count of instances of the given type. This value is computed by a quick iteration over all objects of the requested type. |
|  | GetEnumerator | Enumeration of all objects of the selected Type |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
|  | ElementAt | Override LINQ for faster access (Defined by OfTypeExtension .) |
|  | Skip | Bypasses a specified number of elements in a sequence and then returns the remaining elements. (Defined by OfTypeExtension .) |

See Also

[OfType Class](#)

[VelocityDb Namespace](#)

OfType.Count Method

Get a count of instances of the given type. This value is computed by a quick iteration over all objects of the requested type.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ulong Count ()
```

VB

```
Public Overridable Function Count As ULong
```

C++

```
public:  
virtual unsigned long long Count ()
```

F#

```
abstract Count : unit -> uint64  
override Count : unit -> uint64
```

Return Value

Type: [UInt64](#)

Number of instances found of the given [Type](#)

See Also

[OfType Class](#)

[VelocityDb Namespace](#)

OfType.GetEnumerator Method

Enumeration of all objects of the selected [Type](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerator GetEnumerator()
```

VB

```
Public Function GetEnumerator As IEnumerator
```

C++

```
public:  
virtual IEnumerator^ GetEnumerator() sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerator  
override GetEnumerator : unit -> IEnumerator
```

Return Value

Type: [IEnumerator](#)

The enumeration

Implements

[IEnumerable.GetEnumerator\(\)](#)

See Also

[OfType Class](#)

Iterator for type [OfType](#)

Inheritance Hierarchy

[System.Object](#)

VelocityDb.OfTpe.OfTpeIterator

[VelocityDb.AllObjects\(T\).AllObjectsIterator](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class OfTpeIterator : IEnumerable
```

VB

```
Public Class OfTpeIterator  
    Implements IEnumerable
```

C++

```
public ref class OfTpeIterator : IEnumerable
```

F#

```
type OfTpeIterator =  
    class  
        interface IEnumerable  
    end
```

The OfTpe.OfTpeIterator type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------|
|  | GetEnumerator | Enumeration of all objects of type T |
|  | GetObjects | |
|  | SkipIterator | Bypasses a specified number of elements in a sequence and then returns the remaining elements. |
|  | TakeIterator | Returns a specified number of contiguous elements from the start of a sequence. |

[VelocityDb Namespace](#)

OfTypeIterator.OfTypeIterator Methods

The [OfType.OfTypeIterator](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------|
|  | GetEnumerator | Enumeration of all objects of type T |
|  | GetObjects | |
|  | SkipIterator | Bypasses a specified number of elements in a sequence and then returns the remaining elements. |
|  | TakeIterator | Returns a specified number of contiguous elements from the start of a sequence. |

See Also

[OfType.OfTypeIterator Class](#)

[VelocityDb Namespace](#)

OfType.OfTypeIterator.GetEnumerator Method

Enumeration of all objects of type T

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerator GetEnumerator()
```

VB

```
Public Function GetEnumerator As IEnumerator
```

C++

```
public:  
virtual IEnumerator^ GetEnumerator() sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerator  
override GetEnumerator : unit -> IEnumerator
```

Return Value

Type: [IEnumerator](#)

The enumerator of T

Implements

[IEnumerable.GetEnumerator\(\)](#)

[OfType.OfTypeIterator Class](#)

[VelocityDb Namespace](#)

OfType.OfTypeIterator.SkipIterator Method

Bypasses a specified number of elements in a sequence and then returns the remaining elements.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public IEnumerable SkipIterator(  
    int count  
)
```

```
VB  
Public Function SkipIterator (  
    count As Integer  
) As IEnumerable
```

```
C++  
public:  
IEnumerable^ SkipIterator(  
    int count  
)
```

```
F#  
member SkipIterator :  
    count : int -> IEnumerable
```

Parameters

count

Type: [System.Int32](#)

The number of elements to skip before returning the remaining elements.

Return Value

Type: [IEnumerable](#)

An [IEnumerable](#) that contains the elements that occur after the specified index in the input sequence.

See Also

[OfType.OfTypeIterator Class](#)

[VelocityDb Namespace](#)

OfType.OfTypeIterator.TakeIterator Method

Returns a specified number of contiguous elements from the start of a sequence.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable TakeIterator(  
    int count  
)
```

VB

```
Public Function TakeIterator (  
    count As Integer  
) As IEnumerable
```

C++

```
public:  
IEnumerable^ TakeIterator(  
    int count  
)
```

F#

```
member TakeIterator :  
    count : int -> IEnumerable
```

Parameters

count

Type: [System.Int32](#)

The number of elements to return.

Return Value

Type: [IEnumerable](#)

An [IEnumerable](#) that contains the specified number of elements from the start of the input sequence.

See Also

[OfType.OfTypeIterator Class](#)

[VelocityDb Namespace](#)

OfTypeExtension Class

A few extensions to improve performance of Linq for Objects queries

Inheritance Hierarchy

[System.Object](#)

VelocityDb.OfTypeExtension

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static class OfTypeExtension
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class OfTypeExtension
```

C++

```
[ExtensionAttribute]  
public ref class OfTypeExtension abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type OfTypeExtension = class end
```

The **OfTypeExtension** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------|------------------------------------------------------------------------------------------------|
|  | ElementAt | Override LINQ for faster access |
|  | Skip | Bypasses a specified number of elements in a sequence and then returns the remaining elements. |

See Also

[VelocityDb Namespace](#)

OfTypeExtension.OfTypeExtension Methods

The [OfTypeExtension](#) type exposes the following members.

Methods

| | Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|------------------------------------------------------------------------------------------------|
|   | ElementAt | Override LINQ for faster access |
|   | Skip | Bypasses a specified number of elements in a sequence and then returns the remaining elements. |

[VelocityDb Namespace](#)

OfTypeExtension.ElementAt Method

Override LINQ for faster access

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static Object ElementAt(  
    this OfType source,  
    int index  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Function ElementAt (  
    source As OfType,  
    index As Integer  
) As Object
```

C++

```
public:  
[ExtensionAttribute]  
static Object^ ElementAt(  
    OfType^ source,  
    int index  
)
```

F#

```
[<ExtensionAttribute>]  
static member ElementAt :  
    source : OfType *  
    index : int -> Object
```

Parameters

source

Type: [VelocityDb.OfType](#)

The source enumeration

index

Type: [System.Int32](#)

The index requested

Return Value

Type: [Object](#)

Element at requested index

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [OfType](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

See Also

[OfTypeExtension Class](#)

[VelocityDb Namespace](#)

OfTypeExtension.Skip Method

Bypasses a specified number of elements in a sequence and then returns the remaining elements.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IEnumerable Skip(  
    this OfType source,  
    int count  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Function Skip (  
    source As OfType,  
    count As Integer  
) As IEnumerable
```

C++

```
public:  
[ExtensionAttribute]  
static IEnumerable^ Skip(  
    OfType^ source,  
    int count  
)
```

F#

```
[<ExtensionAttribute>]  
static member Skip :  
    source : OfType *  
    count : int -> IEnumerable
```

Parameters

source

Type: [VelocityDb.OfType](#)

The Type being extended

count

Type: [System.Int32](#)

The number of elements to skip before returning the remaining elements.

Return Value

Type: [IEnumerable](#)

An [IEnumerable](#) that contains the elements that occur after the specified index in the input sequence.

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [OfType](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[OfTypeExtension Class](#)

[VelocityDb Namespace](#)

Oid Structure

The object identifier containing a 32 bit database part, a 16 bit page part and a 16 bit page part. These parts are combined into a 64bit unsigned number [Id](#).

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public struct Oid : IComparable<Oid>, IEqualityComparer<Oid>
```

VB

```
<SerializableAttribute>
Public Structure Oid
    Implements IComparable(Of Oid), IEqualityComparer(Of Oid)
```

C++

```
[SerializableAttribute]
public value class Oid : IComparable<Oid>,
    IEqualityComparer<Oid>
```

F#

```
[<SealedAttribute>]
[<SerializableAttribute>]
type Oid =
    struct
        interface IComparable<Oid>
        interface IEqualityComparer<Oid>
    end
```

The **Oid** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|
|  | Oid(UInt64) | Creates an Oid |
|  | Oid(UInt32, UInt32) | Creates an Oid given a Database number and an OidShort (page-slot) |
|  | Oid(UInt32, OidShort) | Creates an Oid given a Database number and an OidShort (page-slot) |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------|-----------------------------------------------------------|
|  | Database | Gets the database number part of the Oid |
|  | Id | Gets the underlying UInt64 that contains the encoded Oid. |

| | |
|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
|  IdShort | Gets the page-slot parts of the underlying UInt64 that contains the encoded Oid. |
|  Page | Gets the page number part of the Oid |
|  Slot | Gets the slot number part of the Oid |

Methods

| | Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------|------|--------------------------------------------------------------------------------------------------------------|
|  AsString | | Builds a string with DatabaseNumber-PageNumber-SlotNumber |
|  CompareTo | | Compares two Oid objects by id |
|  DatabaseNumber | | Extracts the Database number |
|  Encode(UInt32, UInt32) | | Constructs a UInt64 from the components Database number and an encoded UInt32 contains page and slot number |
|  Encode(UInt32, UInt16, UInt16) | | Constructs a UInt64 from the components Database number, Page number and page number |
|  Equals | | Compares by Id |
|  GetHashCode() | | Computes a hash code based on Id. (Overrides ValueType.GetHashCode().) |
|  GetHashCode(Oid) | | Returns a hash code for the specified object. |
|  IdFromString | | |
|  PageNumber | | Extracts the Page number |
|  SamePageAs | | Find out if Page number is the same in two different UInt64 numbers (encoded Oid) |
|  SlotNumber(UInt64) | | Extracts the page number |
|  SlotNumber(UInt64, UInt16) | | Sets the page number |
|  ToString | | Builds a string with DatabaseNumber-PageNumber-SlotNumber (Overrides ValueType.ToString().) |

Operators

| | Name | Description |
|------------------------------------------------------------------------------------------------------------------------|------|------------------------------|
|  GreaterThan | | Compares the id of two Oid's |
|  GreaterThanOrEqual | | Compares the id of two Oid's |
|  LessThan | | Compares the id of two Oid's |
|  LessThanOrEqual | | Compares the id of two Oid's |

VelocityDB Class Library

Oid Constructor (UInt64)

Creates an Oid

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Oid(  
    ulong id  
)
```

VB

```
Public Sub New (  
    id As ULong  
)
```

C++

```
public:  
Oid(  
    unsigned long long id  
)
```

F#

```
new :  
    id : uint64 -> Oid
```

Parameters

id

Type: [System.UInt64](#)

Highest 32 bit is Database number, then follows the 16 bit Page number and the 16 bit page number

See Also

[Oid Structure](#)

[Oid Overload](#)

[VelocityDb Namespace](#)

Oid Constructor (UInt32, UInt32)

Creates an Oid given a Database number and an OidShort (page-slot)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Oid(  
    uint dbId,  
    uint pageSlotId  
)
```

VB

```
Public Sub New (  
    dbId As UInteger,  
    pageSlotId As UInteger  
)
```

C++

```
public:  
Oid(  
    unsigned int dbId,  
    unsigned int pageSlotId  
)
```

F#

```
new :  
    dbId : uint32 *  
    pageSlotId : uint32 -> Oid
```

Parameters

dbId

Type: [System.UInt32](#)

The Database number

pageSlotId

Type: [System.UInt32](#)

The page and slot numbers as a UInt32

See Also

[Oid Structure](#)

[Oid Overload](#)

Oid Constructor (UInt32, OidShort)

Creates an Oid given a Database number and an OidShort (page-slot)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Oid(  
    uint dbId,  
    OidShort pageSlotId  
)
```

VB

```
Public Sub New (  
    dbId As UInteger,  
    pageSlotId As OidShort  
)
```

C++

```
public:  
Oid(  
    unsigned int dbId,  
    OidShort pageSlotId  
)
```

F#

```
new :  
    dbId : uint32 *  
    pageSlotId : OidShort -> Oid
```

Parameters

dbId

Type: [System.UInt32](#)

The Database number

pageSlotId

Type: [VelocityDb.OidShort](#)

The page and slot numbers as an OidShort

See Also

Oid.Oid Methods

The [Oid](#) type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
|  | AsString | Builds a string with DatabaseNumber-PageNumber-SlotNumber |
|  | CompareTo | Compares two Oid objects by id |
|  | DatabaseNumber | Extracts the Database number |
|  | Encode(UInt32, UInt32) | Constructs a UInt64 from the components Database number and an encoded UInt32 contains page and slot number |
|  | Encode(UInt32, UInt16, UInt16) | Constructs a UInt64 from the components Database number, Page number and page number |
|  | Equals | Compares by Id |
|  | GetHashCode() | Computes a hash code based on Id. (Overrides ValueType.GetHashCode().) |
|  | GetHashCode(Oid) | Returns a hash code for the specified object. |
|  | IdFromString | |
|  | PageNumber | Extracts the Page number |
|  | SamePageAs | Find out if Page number is the same in two different UInt64 numbers (encoded Oid) |
|  | SlotNumber(UInt64) | Extracts the page number |
|  | SlotNumber(UInt64, UInt16) | Sets the page number |
| | ToString | Builds a string with DatabaseNumber-PageNumber-SlotNumber (Overrides ValueType.ToString().) |

[VelocityDb Namespace](#)

Oid.AsString Method

Builds a string with DatabaseNumber-PageNumber-SlotNumber

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static string AsString(  
    ulong id  
)
```

VB

```
Public Shared Function AsString (  
    id As ULong  
) As String
```

C++

```
public:  
static String^ AsString(  
    unsigned long long id  
)
```

F#

```
static member AsString :  
    id : uint64 -> string
```

Parameters

id

Type: [System.UInt64](#)

A combined Database number, Page number and page number

Return Value

Type: [String](#)

DatabaseNumber-PageNumber-SlotNumber

Oid.CompareTo Method

Compares two Oid objects by id

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int CompareTo(  
    Oid otherOid  
)
```

VB

```
Public Function CompareTo (  
    otherOid As Oid  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    Oid otherOid  
) sealed
```

F#

```
abstract CompareTo :  
    otherOid : Oid -> int  
override CompareTo :  
    otherOid : Oid -> int
```

Parameters

otherOid

Type: [VelocityDb.Oid](#)

[Missing <param name="otherOid"/> documentation for "M:VelocityDb.Oid.CompareTo(VelocityDb.Oid)"]

Return Value

Type: [Int32](#)

a negative number if less, 0 if equal or else a positive number

Implements

[IComparable\(T\).CompareTo\(T\)](#)

[VelocityDb Namespace](#)

Oid.DatabaseNumber Method

Extracts the Database number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public static uint DatabaseNumber(  
    ulong id  
)
```

```
VB  
Public Shared Function DatabaseNumber (  
    id As ULong  
) As UInteger
```

```
C++  
public:  
static unsigned int DatabaseNumber(  
    unsigned long long id  
)
```

```
F#  
static member DatabaseNumber :  
    id : uint64 -> uint32
```

Parameters

id

Type: [System.UInt64](#)

The combined Database number, Page number and page number

Return Value

Type: [UInt32](#)

The Database number

Oid.Encode Method (UInt32, UInt32)

Constructs a UInt64 from the components Database number and an encoded UInt32 contains page and slot number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static ulong Encode(  
    uint db,  
    uint pageSlot  
)
```

VB

```
Public Shared Function Encode (  
    db As UInteger,  
    pageSlot As UInteger  
) As ULong
```

C++

```
public:  
static unsigned long long Encode(  
    unsigned int db,  
    unsigned int pageSlot  
)
```

F#

```
static member Encode :  
    db : uint32 *  
    pageSlot : uint32 -> uint64
```

Parameters

db

Type: [System.UInt32](#)

Database number

pageSlot

Type: [System.UInt32](#)

Encoded page and slot number

Return Value

Type: [UInt64](#)

A number containing the full object identifier

VelocityDB Class Library

[Encode Overload](#)

[VelocityDb Namespace](#)

Oid.Encode Method (UInt32, UInt16, UInt16)

Constructs a UInt64 from the components Database number, Page number and page number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static ulong Encode(  
    uint db,  
    ushort page,  
    ushort slot  
)
```

VB

```
Public Shared Function Encode (  
    db As UInteger,  
    page As UShort,  
    slot As UShort  
) As ULong
```

C++

```
public:  
static unsigned long long Encode(  
    unsigned int db,  
    unsigned short page,  
    unsigned short slot  
)
```

F#

```
static member Encode :  
    db : uint32 *  
    page : uint16 *  
    slot : uint16 -> uint64
```

Parameters

db

Type: [System.UInt32](#)

A Database number

page

Type: [System.UInt16](#)

A Page number

slot

Type: [System.UInt16](#)

A slot number

VelocityDB Class Library

Return Value

Type: [UInt64](#)

**[Missing <returns> documentation for
"M:VelocityDb.Oid.Encode(System.UInt32,System.UInt16,System.UInt16)"]**

Oid.Equals Method

Compares by Id

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Equals(  
    Oid x,  
    Oid y  
)
```

VB

```
Public Function Equals (  
    x As Oid,  
    y As Oid  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    Oid x,  
    Oid y  
) sealed
```

F#

```
abstract Equals :  
    x : Oid *  
    y : Oid -> bool  
override Equals :  
    x : Oid *  
    y : Oid -> bool
```

Parameters

x

Type: [VelocityDb.Oid](#)

First object

y

Type: [VelocityDb.Oid](#)

Second object

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for "M:VelocityDb.Oid.Equals(VelocityDb.Oid,VelocityDb.Oid)"]

VelocityDB Class Library

Implements

[IEqualityComparer\(T\).Equals\(T, T\)](#)

[VelocityDb Namespace](#)

Oid.GetHashCode Method (Oid)

Returns a hash code for the specified object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int GetHashCode (  
    Oid a  
)
```

VB

```
Public Function GetHashCode (  
    a As Oid  
) As Integer
```

C++

```
public:  
virtual int GetHashCode (  
    Oid a  
) sealed
```

F#

```
abstract GetHashCode :  
    a : Oid -> int  
override GetHashCode :  
    a : Oid -> int
```

Parameters

a

Type: [VelocityDb.Oid](#)

[Missing <param name="a"/> documentation for "M:VelocityDb.Oid.GetHashCode(VelocityDb.Oid)"]

Return Value

Type: [Int32](#)

A hash code for the specified object.

Implements

[IEqualityComparer\(T\).GetHashCode\(T\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------|----------------------------------------------------------------------------------------------------------|
| ArgumentNullException | The type of <i>obj</i> is a reference type and <i>obj</i> is a null reference (Nothing in Visual Basic). |

Oid.PageNumber Method

Extracts the Page number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static ushort PageNumber(  
    ulong id  
)
```

VB

```
Public Shared Function PageNumber (  
    id As ULong  
) As UShort
```

C++

```
public:  
static unsigned short PageNumber(  
    unsigned long long id  
)
```

F#

```
static member PageNumber :  
    id : uint64 -> uint16
```

Parameters

id

Type: [System.UInt64](#)

The combined Database number, Page number and page number

Return Value

Type: [UInt16](#)

The Page number

See Also

[VelocityDb Namespace](#)

Oid.SamePageAs Method

Find out if Page number is the same in two different UInt64 numbers (encoded Oid)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool SamePageAs (  
    ulong id,  
    ulong anId  
)
```

VB

```
Public Shared Function SamePageAs (  
    id As ULong,  
    anId As ULong  
) As Boolean
```

C++

```
public:  
static bool SamePageAs (  
    unsigned long long id,  
    unsigned long long anId  
)
```

F#

```
static member SamePageAs :  
    id : uint64 *  
    anId : uint64 -> bool
```

Parameters

id

Type: [System.UInt64](#)

A combined Database number, Page number and page number

anId

Type: [System.UInt64](#)

Another combined Database number, Page number and skot number

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for

"M:VelocityDb.Oid.SamePageAs(System.UInt64,System.UInt64)"]

)
```

```
F#  
static member SlotNumber :  
    oid : uint64 *  
    slotNumber : uint16 -> uint64
```

Parameters

oid

Type: [System.UInt64](#)

A combined Database number, Page number and page number

slotNumber

Type: [System.UInt16](#)

A slot number to use in the combined UInt64 value

Return Value

Type: [UInt64](#)

A combined Database number, Page number and an updated page number

Oid.GreaterThan Operator

Compares the id of two Oid's

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool operator >(
    Oid a,
    Oid b
)
```

VB

```
Public Shared Operator > (
    a As Oid,
    b As Oid
) As Boolean
```

C++

```
public:
static bool operator >(
    Oid a,
    Oid b
)
```

F#

```
static let inline (>)
    a : Oid *
    b : Oid : bool
```

Parameters

a

Type: [VelocityDb.Oid](#)

First Oid

b

Type: [VelocityDb.Oid](#)

Second Oid

Return Value

Type: [Boolean](#)

a.id > b.id

See Also

[Oid Structure](#)

[VelocityDb Namespace](#)

Oid.GreaterThanOrEqual Operator

Compares the id of two Oid's

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public static bool operator >=(  
    Oid a,  
    Oid b  
)
```

```
VB  
Public Shared Operator >= (  
    a As Oid,  
    b As Oid  
) As Boolean
```

```
C++  
public:  
static bool operator >=(  
    Oid a,  
    Oid b  
)
```

```
F#  
static let inline (>=)  
    a : Oid *  
    b : Oid : bool
```

Parameters

a

Type: [VelocityDb.Oid](#)

First Oid

b

Type: [VelocityDb.Oid](#)

Second Oid

Return Value

Type: [Boolean](#)

a.id >= b.id

See Also

[Oid Structure](#)

[VelocityDb Namespace](#)

Oid.LessThan Operator

Compares the id of two Oid's

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool operator <(
    Oid a,
    Oid b
)
```

VB

```
Public Shared Operator < (
    a As Oid,
    b As Oid
) As Boolean
```

C++

```
public:
static bool operator <(
    Oid a,
    Oid b
)
```

F#

```
static let inline (<)
    a : Oid *
    b : Oid : bool
```

Parameters

a

Type: [VelocityDb.Oid](#)

First Oid

b

Type: [VelocityDb.Oid](#)

Second Oid

Return Value

Type: [Boolean](#)

a.id less than b.id

See Also

[Oid Structure](#)

[VelocityDb Namespace](#)

Oid.LessThanOrEqual Operator

Compares the id of two Oid's

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public static bool operator <=(  
    Oid a,  
    Oid b  
)
```

```
VB  
Public Shared Operator <= (  
    a As Oid,  
    b As Oid  
) As Boolean
```

```
C++  
public:  
static bool operator <=(  
    Oid a,  
    Oid b  
)
```

```
F#  
static let inline (<=)  
    a : Oid *  
    b : Oid : bool
```

Parameters

a

Type: [VelocityDb.Oid](#)

First Oid

b

Type: [VelocityDb.Oid](#)

Second Oid

Return Value

Type: [Boolean](#)

a.id less or equal to b.id

See Also

[Oid Structure](#)

[VelocityDb Namespace](#)

OidShort Structure

The short object identifier containing a 16 bit page part and a 16 bit page part. This is used for short references within a single databases.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public struct OidShort : IComparable<OidShort>,
    IEqualityComparer<OidShort>
```

VB

```
<SerializableAttribute>
Public Structure OidShort
    Implements IComparable(Of OidShort), IEqualityComparer(Of OidShort)
```

C++

```
[SerializableAttribute]
public value class OidShort : IComparable<OidShort>,
    IEqualityComparer<OidShort>
```

F#

```
[<SealedAttribute>]
[<SerializableAttribute>]
type OidShort =
    struct
        interface IComparable<OidShort>
        interface IEqualityComparer<OidShort>
    end
```

The **OidShort** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------------|------------------------------------------------------------------------|
|  | OidShort(UInt32) | Constructs an OidShort given a 32bit number |
|  | OidShort(UInt64) | Constructs an OidShort given a 64bit number by using the 32 lower bits |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------|---------------------------------------|
|  | Id | Gets the OidShort encoded as a UInt32 |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
|  | AsString | Builds a string with DatabaseNumber-PageNumber-SlotNumber |
|  | Compare | Compares by Id |
|  | CompareTo | Compares two OidShort objects by id |
|  | Encode | Merges a page number and a page number into a single number |
|  | Equals(Object) | Indicates whether this instance and a specified object are equal. (Overrides ValueType.Equals(Object) .) |
|  | Equals(OidShort, OidShort) | Determines whether the specified objects are equal. |
|  | GetHashCode() | Returns the hash code for this instance. (Overrides ValueType.GetHashCode() .) |
|  | GetHashCode(OidShort) | Returns a hash code for the specified object. |
|  | PageNumber | Extracts a Page number from a combined Page-Slot number |
|  | SamePageAs | Determines if two encoded OidShort have the same Page number |
|  | SlotNumber(UInt32) | Extracts a page number |
|  | SlotNumber(UInt32, UInt16) | Sets a page number |
|  | ToString | Builds a string with PageNumber-SlotNumber (Overrides ValueType.ToString() .) |

Operators

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|-----------------------------|
|  | Equality | Compares id of two OidShort |
|  | Inequality | Compares id of two OidShort |

See Also

Builds a string with DatabaseNumber-PageNumber-SlotNumber

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static string AsString(  
    uint id  
)
```

VB

```
Public Shared Function AsString (  
    id As UInteger  
) As String
```

C++

```
public:  
static String^ AsString(  
    unsigned int id  
)
```

F#

```
static member AsString :  
    id : uint32 -> string
```

Parameters

id

Type: [System.UInt32](#)

A combined Page number and page number

Return Value

Type: [String](#)

PageNumber-SlotNumber

See Also

[OidShort Structure](#)

[VelocityDb Namespace](#)

OidShort.Compare Method

Compares by Id

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static int Compare(  
    OidShort aId,  
    OidShort bId  
)
```

VB

```
Public Shared Function Compare (  
    aId As OidShort,  
    bId As OidShort  
) As Integer
```

C++

```
public:  
static int Compare(  
    OidShort aId,  
    OidShort bId  
)
```

F#

```
static member Compare :  
    aId : OidShort *  
    bId : OidShort -> int
```

Parameters

aId

Type: [VelocityDb.OidShort](#)

First object

bId

Type: [VelocityDb.OidShort](#)

Second object

Return Value

Type: [Int32](#)

Comparison value, -1 for less, 0 for equal and 1 for greater than

See Also

[VelocityDb Namespace](#)

OidShort.CompareTo Method

Compares two OidShort objects by id

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int CompareTo(  
    OidShort obj  
)
```

VB

```
Public Function CompareTo (  
    obj As OidShort  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    OidShort obj  
) sealed
```

F#

```
abstract CompareTo :  
    obj : OidShort -> int  
override CompareTo :  
    obj : OidShort -> int
```

Parameters

obj

Type: [VelocityDb.OidShort](#)

The object to compare with

Return Value

Type: [Int32](#)

a negative number if less, 0 if equal or else a positive number

Implements

[IComparable\(T\).CompareTo\(T\)](#)

See Also

[OidShort Structure](#)

[VelocityDb Namespace](#)

OidShort.Encode Method

Merges a page number and a page number into a single number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static uint Encode(  
    ushort page,  
    ushort slot  
)
```

VB

```
Public Shared Function Encode (  
    page As UShort,  
    slot As UShort  
) As UInteger
```

C++

```
public:  
static unsigned int Encode(  
    unsigned short page,  
    unsigned short slot  
)
```

F#

```
static member Encode :  
    page : uint16 *  
    slot : uint16 -> uint32
```

Parameters

page

Type: [System.UInt16](#)

A Page number

slot

Type: [System.UInt16](#)

A slot number

Return Value

Type: [UInt32](#)

The combined Page and page number

OidShort.Equals Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
|  | Equals(Object) | Indicates whether this instance and a specified object are equal. (Overrides ValueType.Equals(Object) .) |
|  | Equals(OidShort, OidShort) | Determines whether the specified objects are equal. |

See Also

[OidShort Structure](#)

[VelocityDb Namespace](#)

OidShort.Equals Method (Object)

Indicates whether this instance and a specified object are equal.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool Equals(  
    Object obj  
)
```

VB

```
Public Overrides Function Equals (  
    obj As Object  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    Object^ obj  
) override
```

F#

```
abstract Equals :  
    obj : Object -> bool  
override Equals :  
    obj : Object -> bool
```

Parameters

obj

Type: [System.Object](#)

The object to compare with the current instance.

Return Value

Type: [Boolean](#)

`true` (`True` in Visual Basic) if *obj* and this instance are the same type and represent the same value; otherwise, `false` (`False` in Visual Basic).

See Also

[OidShort Structure](#)

[Equals Overload](#)

[VelocityDb Namespace](#)

OidShort.Equals Method (OidShort, OidShort)

Determines whether the specified objects are equal.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Equals(  
    OidShort x,  
    OidShort y  
)
```

VB

```
Public Function Equals (  
    x As OidShort,  
    y As OidShort  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    OidShort x,  
    OidShort y  
) sealed
```

F#

```
abstract Equals :  
    x : OidShort *  
    y : OidShort -> bool  
override Equals :  
    x : OidShort *  
    y : OidShort -> bool
```

Parameters

x

Type: [VelocityDb.OidShort](#)

The first object of type *T* to compare.

y

Type: [VelocityDb.OidShort](#)

The second object of type *T* to compare.

Return Value

Type: [Boolean](#)

`true` (True in Visual Basic) if the specified objects are equal; otherwise, `false` (False in Visual Basic).

OidShort.GetHashCode Method

Returns the hash code for this instance.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override int GetHashCode()
```

VB

```
Public Overrides Function GetHashCode As Integer
```

C++

```
public:  
virtual int GetHashCode() override
```

F#

```
abstract GetHashCode : unit -> int  
override GetHashCode : unit -> int
```

Return Value

Type: [Int32](#)

A 32-bit signed integer that is the hash code for this instance.

See Also

[OidShort Structure](#)

[GetHashCode Overload](#)

[VelocityDb Namespace](#)

OidShort.GetHashCode Method (OidShort)

Returns a hash code for the specified object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int GetHashCode(  
    OidShort a  
)
```

VB

```
Public Function GetHashCode (  
    a As OidShort  
) As Integer
```

C++

```
public:  
virtual int GetHashCode(  
    OidShort a  
) sealed
```

F#

```
abstract GetHashCode :  
    a : OidShort -> int  
override GetHashCode :  
    a : OidShort -> int
```

Parameters

a

Type: [VelocityDb.OidShort](#)

[Missing <param name="a"/> documentation for "M:VelocityDb.OidShort.GetHashCode(VelocityDb.OidShort)"]

Return Value

Type: [Int32](#)

A hash code for the specified object.

Implements

[IEqualityComparer\(T\).GetHashCode\(T\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------|
| ArgumentNullException | The type of <i>obj</i> is a reference type and <i>obj</i> is a null reference (<i>Nothing</i> in Visual Basic). |

OidShort.PageNumber Method

Extracts a Page number from a combined Page-Slot number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public static ushort PageNumber(  
    uint id  
)
```

```
VB  
Public Shared Function PageNumber (  
    id As UInteger  
) As UShort
```

```
C++  
public:  
static unsigned short PageNumber(  
    unsigned int id  
)
```

```
F#  
static member PageNumber :  
    id : uint32 -> uint16
```

Parameters

id

Type: [System.UInt32](#)

Combined Page and page number

Return Value

Type: [UInt16](#)

A Page number

OidShort.SamePageAs Method

Determines if two encoded OidShort have the same Page number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool SamePageAs (  
    uint id,  
    uint anId  
)
```

VB

```
Public Shared Function SamePageAs (  
    id As UInteger,  
    anId As UInteger  
) As Boolean
```

C++

```
public:  
static bool SamePageAs (  
    unsigned int id,  
    unsigned int anId  
)
```

F#

```
static member SamePageAs :  
    id : uint32 *  
    anId : uint32 -> bool
```

Parameters

id

Type: [System.UInt32](#)

[Missing <param name="id"/> documentation for

"M:VelocityDb.OidShort.SamePageAs(System.UInt32,System.UInt32)"]

anId

Type: [System.UInt32](#)

[Missing <param name="anId"/> documentation for

"M:VelocityDb.OidShort.SamePageAs(System.UInt32,System.UInt32)"]

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for

"M:VelocityDb.OidShort.SamePageAs(System.UInt32,System.UInt32)"]

OidShort.SlotNumber Method (UInt32, UInt16)

Sets a page number

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public static ulong SlotNumber(  
    uint oid,  
    ushort slotNumber  
)
```

```
VB  
Public Shared Function SlotNumber (  
    oid As UInteger,  
    slotNumber As UShort  
) As ULong
```

```
C++  
public:  
static unsigned long long SlotNumber(  
    unsigned int oid,  
    unsigned short slotNumber  
)
```

```
F#  
static member SlotNumber :  
    oid : uint32 *  
    slotNumber : uint16 -> uint64
```

Parameters

oid

Type: [System.UInt32](#)

Combined Page and page number

slotNumber

Type: [System.UInt16](#)

Slot number to use

Return Value

Type: [UInt64](#)

A combined Page number with an updated page number

[VelocityDb Namespace](#)

OidShort.Equality Operator

Compares id of two OidShort

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool operator ==(
    OidShort a,
    OidShort b
)
```

VB

```
Public Shared Operator = (
    a As OidShort,
    b As OidShort
) As Boolean
```

C++

```
public:
static bool operator ==(
    OidShort a,
    OidShort b
)
```

F#

```
static let inline (=)
    a : OidShort *
    b : OidShort : bool
```

Parameters

a

Type: [VelocityDb.OidShort](#)

first OidShort

b

Type: [VelocityDb.OidShort](#)

other OidShort

Return Value

Type: [Boolean](#)

true if id's are ==

See Also

[OidShort Structure](#)

[VelocityDb Namespace](#)

OidShort.Inequality Operator

Compares id of two OidShort

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public static bool operator !=(  
    OidShort a,  
    OidShort b  
)
```

```
VB  
Public Shared Operator <> (  
    a As OidShort,  
    b As OidShort  
) As Boolean
```

```
C++  
public:  
static bool operator !=(  
    OidShort a,  
    OidShort b  
)
```

```
F#  
static let inline (<>)  
    a : OidShort *  
    b : OidShort : bool
```

Parameters

a

Type: [VelocityDb.OidShort](#)

first OidShort

b

Type: [VelocityDb.OidShort](#)

other OidShort

Return Value

Type: [Boolean](#)

true if id's are !=

[VelocityDb Namespace](#)

OpFlags Enumeration

Flag bits for a persistent object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public enum OpFlags
```

VB

```
Public Enumeration OpFlags
```

C++

```
public enum class OpFlags
```

F#

```
type OpFlags
```

Members

| Member name | Value | Description |
|---------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IsUpdated | 1 | Object is updated |
| MembersLoaded | 2 | All members have been loaded |
| RemovedFromIndices | 4 | Call to Update() removed object from indices. If UpdateObject(IOptimizedPersistable, Boolean, Boolean) was used with 3rd parameter false, object is not removed from indices (flag value set accordingly) |

[VelocityGraph.VertexType](#)Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class OptimizedPersistable : IOptimizedPersistable,
    IComparable, ICloneable
```

VB

```
<SerializableAttribute>
Public Class OptimizedPersistable
    Implements IOptimizedPersistable, IComparable, ICloneable
```

C++

```
[SerializableAttribute]
public ref class OptimizedPersistable : IOptimizedPersistable,
    IComparable, ICloneable
```

F#

```
[<SerializableAttribute>]
type OptimizedPersistable =
    class
        interface IOptimizedPersistable
        interface IComparable
        interface ICloneable
    end
```

The **OptimizedPersistable** type exposes the following members.

Constructors

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  OptimizedPersistable() | The default constructor can be used to create simple OptimizedPersistable objects. |
|  OptimizedPersistable(UInt64) | This constructor can be used in cases where the object id is known but you don't want to open the object, maybe you just want to add this object to a BTreeSet. |

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override |

| | | |
|-------------------------------------------------------------------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | this to return false for types that should not share pages with other types. |
|  | Cache | By default, the an object cache is determined by a SessionBase constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do. |
|  | DatabaseNumber | Gets the database number of this object. |
|  | FieldsLoaded | Gets the field members load state. By default, all members are loaded when a persistent object is opened but if an overrode of LazyLoadFields returns true then the object members are loaded by calling <code>[:OptimizedPersistable.LoadFields]</code> |
|  | FlushIfPageFull | By default we flush (write) any updated page we find when looking for an object placement page and the page is considered full (depends on how many objects we permit/page) |
|  | Id | Gets the id of this object. The id is structured as Oid |
|  | IsPersistent | Gets the persistent state of an object. An object is considered persistent when it has an Oid , that is the Id is not 0 |
|  | IsUpdated | Gets the updated state of the object |
|  | LazyLoadFields | By default all fields are loaded when opening a persistent object but an option is provided to load members on demand (lazy loading). |
|  | MaxNumberOfDatabases | Possibly restrict instances of to a single Database. By default this property is <code>UInt32.MaxValue</code> but classes like <code>BTreeSetOidShort</code> , <code>BTreeMapShortOid</code> ... override this property to return 1 since short references are restricted to a single Database. |
|  | ObjectsPerPage | A default for number of objects per database page used when persisting objects without an explicit Placement object or if persisted using Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent. |
|  | Oid | Gets the object identifier represented as an Oid . |
|  | OidShort | Gets the OidShort part of the object Oid |
|  | PageNumber | Gets the page number part of the object Oid (Id) |
|  | PagesPerDatabase | A default for number of objects per database page used when persisting objects without an explicit Placement object or if persisted using Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) This happens when objects are persisted by reachability |

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | from a persistent object. All objects reachable from a persistent object are automatically made persistent. |
|  | PlacementDatabaseNumber | Gets the Database Id number to use when placing (persisting) an instance of this class when no other placement directive has been given. |
|  | RemovedFromIndices | <code>true</code> if call to [!:Update(bool)] or UpdateObject(IOptimizedPersistable, Boolean, Boolean) caused this object to be removed from possible indices |
|  | ShortId | Gets the short id of this object. The id is structured as OidShort |
|  | SlotNumber | Gets the page number from the object identifier |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Clone | See MemberwiseClone() |
|  | CompareTo | Compares objects using the object Id |
|  | Equals | Determines whether the specified Object is equal to the current Object. If this object or other object isn't persistent we call Equals(Object) (Overrides Object.Equals(Object) .) |
|  | FlushTransients | Process data in transient fields (if any), do whatever is required to persist such data if needed. By default does nothing. |
|  | GetDataMembers | Gets a list of the fields meta data objects |
|  | GetFieldValues | Returns a list of field values of this object or returns it as an array (if this is an array) |
|  | GetHashCode | Computes a hash code based on Oid of object. Make sure to persist objects before using GetHashCode() or override GetHashCode() (Overrides Object.GetHashCode() .) |
|  | GetPage | Get the persistent storage Page of this object |
|  | GetSession | Gets the session of this object or null if this object isn't yet persisted. |
|  | GetTypeVersion | The database engine needs this internally |
|  | GetWrappedObject | Internally used when IOptimizedPersistable is a wrapper for a non IOptimizedPersistable |
|  | InitializeAfterRead | This function is called when an object has been read from disk and all data members (fields) have been loaded. Override this to provide your own initializations of transient data. |
|  | InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully |

| | | |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | loaded. Override this to provide your own initializations of transient data. |
|  | ListToString | This is a support function for the VelocityDbBrowser |
|  | OidOf | Gets the Oid (encoded as an UInt64) of a non OptimizedPersistable object or 0 if the object isn't persistent on the same page as this object. |
|  | Open(UInt32, Boolean, Boolean) | Opens a persistent object located in the same Database as this object |
|  | Open(T)(UInt32, Boolean, Boolean) | Opens a persistent object located in the same Database as this object |
|  | OptimizedPersistableFieldValues | Gets a list of all field values of the current object that are subclasses of OptimizedPersistable |
|  | Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) | Persists this object. |
|  | Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. |
|  | PersistentVersion | Gets the page version of a persistent object |
|  | PersistMyReferences | Persists references from this object |
|  | ReadMe | Used by code generator |
|  | ReadMeUsingSchemaReflection | Used by code generator. By default objects are read and written using persisted schema information and reflection. |
|  | SetPage | Sets the persistent storage Page of this object |
|  | SetTypeVersion | The database engine needs this internally |
|  | ShallowCopyTo | Internal use for now |
|  | ToString | Displays class name plus object id (Overrides Object.ToString() .) |
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. |
|  | Update() | Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! |
|  | Update(Action) | Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! Add code to update object in Action parameter. |

| | |
|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  UpdateNonIndexField | Marks an object as being updated so that object will be written at commit transaction. Call before updating a NON indexed field. Same as Update() but avoids deleting object from indices (if any). If updating a field used in any index, call Update() instead or you may end up with one or more corrupt indices. |
|  UpdateTypeVersion | Updates the object and make this object use the latest Type definition for its class. The object now will now adjust for data attribute changes. |
|  Write | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page will also be written. |
|  WriteMe | Used by code generator. |
|  WriteMeUsingSchemaReflection | Used by code generator. This is the default way of writing objects using schema information and .NET reflection info. |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

[VelocityDb Namespace](#)

OptimizedPersistable Constructor

The default constructor can be used to create simple OptimizedPersistable objects.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public OptimizedPersistable ()
```

VB

```
Public Sub New
```

C++

```
public:  
OptimizedPersistable ()
```

F#

```
new : unit -> OptimizedPersistable
```

[VelocityDb Namespace](#)

OptimizedPersistable Constructor (UInt64)

This constructor can be used in cases where the object id is known but you don't want to open the object, maybe you just want to add this object to a BTreeSet.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public OptimizedPersistable(  
    ulong id  
)
```

VB

```
Public Sub New (  
    id As ULong  
)
```

C++

```
public:  
OptimizedPersistable(  
    unsigned long long id  
)
```

F#

```
new :  
    id : uint64 -> OptimizedPersistable
```

Parameters

id

Type: [System.UInt64](#)

Object id to use for this object

OptimizedPersistable.OptimizedPersistable Properties

The [OptimizedPersistable](#) type exposes the following members.

Properties

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types. |
|  Cache | By default, the an object cache is determined by a SessionBase constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do. |
|  DatabaseNumber | Gets the database number of this object. |
|  FieldsLoaded | Gets the field members load state. By default, all members are loaded when a persistent object is opened but if an overrode of LazyLoadFields returns true then the object members are loaded by calling [!:OptimizedPersistable.LoadFields] |
|  FlushIfPageFull | By default we flush (write) any updated page we find when looking for an object placement page and the page is considered full (depends on how many objects we permit/page) |
|  Id | Gets the id of this object. The id is structured as Oid |
|  IsPersistent | Gets the persistent state of an object. An object is considered persistent when it has an Oid , that is the Id is not 0 |
|  IsUpdated | Gets the updated state of the object |
|  LazyLoadFields | By default all fields are loaded when opening a persistent object but an option is provided to load members on demand (lazy loading). |
|  MaxNumberOfDatabases | Possibly restrict instances of to a single Database. By default this property is UInt32.MaxValue but classes like BTreeSetOidShort, BTreeMapShortOid ... override this property to return 1 since short references are restricted to a single Database. |
|  ObjectsPerPage | A default for number of objects per database page used when persisting objects without an explicit Placement object or if persisted using Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent. |

| | |
|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Oid | Gets the object identifier represented as an Oid . |
|  OidShort | Gets the OidShort part of the object Oid |
|  PageNumber | Gets the page number part of the object Oid (Id) |
|  PagesPerDatabase | A default for number of objects per database page used when persisting objects without an explicit Placement object or if persisted using Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent. |
|  PlacementDatabaseNumber | Gets the Database Id number to use when placing (persisting) an instance of this class when no other placement directive has been given. |
|  RemovedFromIndices | true if call to [!:Update(bool)] or UpdateObject(IOptimizedPersistable, Boolean, Boolean) caused this object to be removed from possible indices |
|  ShortId | Gets the short id of this object. The id is structured as OidShort |
|  SlotNumber | Gets the page number from the object identifier |

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.AllowOtherTypesOnSamePage Property

Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool AllowOtherTypesOnSamePage { get; }
```

VB

```
Public Overridable ReadOnly Property AllowOtherTypesOnSamePage As Boolean  
    Get
```

C++

```
public:  
virtual property bool AllowOtherTypesOnSamePage {  
    bool get ();  
}
```

F#

```
abstract AllowOtherTypesOnSamePage : bool with get  
override AllowOtherTypesOnSamePage : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.AllowOtherTypesOnSamePage](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Cache Property

By default, the an object cache is determined by a [SessionBase](#) constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual CacheEnum Cache { get; }
```

VB

```
Public Overridable ReadOnly Property Cache As CacheEnum  
    Get
```

C++

```
public:  
virtual property CacheEnum Cache {  
    CacheEnum get ();  
}
```

F#

```
abstract Cache : CacheEnum with get  
override Cache : CacheEnum with get
```

Property Value

Type: [CacheEnum](#)

Implements

[IOptimizedPersistable.Cache](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.DatabaseNumber Property

Gets the database number of this object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint DatabaseNumber { get; }
```

VB

```
Public ReadOnly Property DatabaseNumber As UInteger  
    Get
```

C++

```
public:  
property unsigned int DatabaseNumber {  
    unsigned int get ();  
}
```

F#

```
member DatabaseNumber : uint32 with get
```

Property Value

Type: [UInt32](#)

The database number of this object or 0 if object is not persistent

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.FieldsLoaded Property

Gets the field members load state. By default, all members are loaded when a persistent object is opened but if an override of [LazyLoadFields](#) returns true then the object members are loaded by calling **[!:OptimizedPersistable.LoadFields]**

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool FieldsLoaded { get; set; }
```

VB

```
Public Property FieldsLoaded As Boolean  
    Get  
    Set
```

C++

```
public:  
virtual property bool FieldsLoaded {  
    bool get () sealed;  
    void set (bool value) sealed;  
}
```

F#

```
abstract FieldsLoaded : bool with get, set  
override FieldsLoaded : bool with get, set
```

Property Value

Type: [Boolean](#)

true if all members are loaded; otherwise false

Implements

[IOptimizedPersistable.FieldsLoaded](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.FlushIfPageFull Property

By default we flush (write) any updated page we find when looking for an object placement page and the page is considered full (depends on how many objects we permit/page)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool FlushIfPageFull { get; }
```

VB

```
Public Overridable ReadOnly Property FlushIfPageFull As Boolean  
    Get
```

C++

```
public:  
virtual property bool FlushIfPageFull {  
    bool get ();  
}
```

F#

```
abstract FlushIfPageFull : bool with get  
override FlushIfPageFull : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.FlushIfPageFull](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Id Property

Gets the id of this object. The id is structured as [Oid](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong Id { get; set; }
```

VB

```
Public Property Id As ULong  
    Get  
    Set
```

C++

```
public:  
virtual property unsigned long long Id {  
    unsigned long long get () sealed;  
    void set (unsigned long long value) sealed;  
}
```

F#

```
abstract Id : uint64 with get, set  
override Id : uint64 with get, set
```

Property Value

Type: [UInt64](#)

The id of this object or 0 if object is not persistent

Implements

[IOptimizedPersistable.Id](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.IsPersistent Property

Gets the persistent state of an object. An object is considered persistent when it has an [Oid](#), that is the [Id](#) is not 0

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool IsPersistent { get; }
```

VB

```
Public ReadOnly Property IsPersistent As Boolean  
    Get
```

C++

```
public:  
virtual property bool IsPersistent {  
    bool get () sealed;  
}
```

F#

```
abstract IsPersistent : bool with get  
override IsPersistent : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.IsPersistent](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.IsUpdated Property

Gets the updated state of the object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool IsUpdated { get; set; }
```

VB

```
Public Overridable Property IsUpdated As Boolean  
    Get  
    Set
```

C++

```
public:  
virtual property bool IsUpdated {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
abstract IsUpdated : bool with get, set  
override IsUpdated : bool with get, set
```

Property Value

Type: [Boolean](#)

true if updated; otherwise false

Implements

[IOptimizedPersistable.IsUpdated](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.LazyLoadFields Property

By default all fields are loaded when opening a persistent object but an option is provided to load members on demand (lazy loading).

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool LazyLoadFields { get; }
```

VB

```
Public Overridable ReadOnly Property LazyLoadFields As Boolean  
    Get
```

C++

```
public:  
virtual property bool LazyLoadFields {  
    bool get ();  
}
```

F#

```
abstract LazyLoadFields : bool with get  
override LazyLoadFields : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.LazyLoadFields](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.MaxNumberOfDatabases Property

Possibly restrict instances to a single Database. By default this property is UInt32.MaxValue but classes like BTreeSetOidShort, BTreeMapShortOid ... override this property to return 1 since short references are restricted to a single Database.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual uint MaxNumberOfDatabases { get; }
```

VB

```
Public Overridable ReadOnly Property MaxNumberOfDatabases As UInteger  
    Get
```

C++

```
public:  
virtual property unsigned int MaxNumberOfDatabases {  
    unsigned int get ();  
}
```

F#

```
abstract MaxNumberOfDatabases : uint32 with get  
override MaxNumberOfDatabases : uint32 with get
```

Property Value

Type: [UInt32](#)

Implements

[IOptimizedPersistable.MaxNumberOfDatabases](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.ObjectsPerPage Property

A default for number of objects per database page used when persisting objects without an explicit [Placement](#) object or if persisted using [Persist\(SessionBase, IOptimizedPersistable, Boolean, Boolean\)](#). This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ushort ObjectsPerPage { get; }
```

VB

```
Public Overridable ReadOnly Property ObjectsPerPage As UShort  
    Get
```

C++

```
public:  
virtual property unsigned short ObjectsPerPage {  
    unsigned short get ();  
}
```

F#

```
abstract ObjectsPerPage : uint16 with get  
override ObjectsPerPage : uint16 with get
```

Return Value

Type: [UInt16](#)

The requested number of objects per page.

Implements

[IOptimizedPersistable.ObjectsPerPage](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Oid Property

Gets the object identifier represented as an **Oid**.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Oid Oid { get; }
```

VB

```
Public ReadOnly Property Oid As Oid  
    Get
```

C++

```
public:  
property Oid Oid {  
    Oid get ();  
}
```

F#

```
member Oid : Oid with get
```

Property Value

Type: [Oid](#)

The **Oid** of the object

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.OidShort Property

Gets the OidShort part of the object Oid

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public OidShort OidShort { get; }
```

VB

```
Public ReadOnly Property OidShort As OidShort  
    Get
```

C++

```
public:  
property OidShort OidShort {  
    OidShort get ();  
}
```

F#

```
member OidShort : OidShort with get
```

Property Value

Type: [OidShort](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.PageNumber Property

Gets the page number part of the object Oid (Id)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort PageNumber { get; }
```

VB

```
Public ReadOnly Property PageNumber As UShort  
    Get
```

C++

```
public:  
property unsigned short PageNumber {  
    unsigned short get ();  
}
```

F#

```
member PageNumber : uint16 with get
```

Property Value

Type: [UInt16](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.PagesPerDatabase Property

A default for number of objects per database page used when persisting objects without an explicit [Placement](#) object or if persisted using [Persist\(SessionBase, IOptimizedPersistable, Boolean, Boolean\)](#). This happens when objects are persisted by reachability from a persistent object. All objects reachable from a persistent object are automatically made persistent.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ushort PagesPerDatabase { get; }
```

VB

```
Public Overridable ReadOnly Property PagesPerDatabase As UShort  
    Get
```

C++

```
public:  
virtual property unsigned short PagesPerDatabase {  
    unsigned short get ();  
}
```

F#

```
abstract PagesPerDatabase : uint16 with get  
override PagesPerDatabase : uint16 with get
```

Return Value

Type: [UInt16](#)

The requested number of pages per database

Implements

[IOptimizedPersistable.PagesPerDatabase](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.PlacementDatabaseNumber Property

Gets the Database Id number to use when placing (persisting) an instance of this class when no other placement directive has been given.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual uint PlacementDatabaseNumber { get; }
```

VB

```
Public Overridable ReadOnly Property PlacementDatabaseNumber As UInteger  
    Get
```

C++

```
public:  
virtual property unsigned int PlacementDatabaseNumber {  
    unsigned int get ();  
}
```

F#

```
abstract PlacementDatabaseNumber : uint32 with get  
override PlacementDatabaseNumber : uint32 with get
```

Property Value

Type: [UInt32](#)

Implements

[IOptimizedPersistable.PlacementDatabaseNumber](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.RemovedFromIndices Property

true

if call to **[!:Update(bool)]** or [UpdateObject\(IOptimizedPersistable, Boolean, Boolean\)](#) caused this object to be removed from possible indices

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool RemovedFromIndices { get; set; }
```

VB

```
Public Property RemovedFromIndices As Boolean  
    Get  
    Set
```

C++

```
public:  
virtual property bool RemovedFromIndices {  
    bool get () sealed;  
    void set (bool value) sealed;  
}
```

F#

```
abstract RemovedFromIndices : bool with get, set  
override RemovedFromIndices : bool with get, set
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.RemovedFromIndices](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.ShortId Property

Gets the short id of this object. The id is structured as [OidShort](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint ShortId { get; }
```

VB

```
Public ReadOnly Property ShortId As UInteger  
    Get
```

C++

```
public:  
property unsigned int ShortId {  
    unsigned int get ();  
}
```

F#

```
member ShortId : uint32 with get
```

Property Value

Type: [UInt32](#)

The short id of this object or 0 if object is not persistent

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.SlotNumber Property

Gets the page number from the object identifier

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort SlotNumber { get; }
```

VB

```
Public ReadOnly Property SlotNumber As UShort  
    Get
```

C++

```
public:  
property unsigned short SlotNumber {  
    unsigned short get ();  
}
```

F#

```
member SlotNumber : uint16 with get
```

Property Value

Type: [UInt16](#)

the page number of this object

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.OptimizedPersistable Methods

The [OptimizedPersistable](#) type exposes the following members.

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Clone | See MemberwiseClone() |
|  CompareTo | Compares objects using the object Id |
|  Equals | Determines whether the specified Object is equal to the current Object. If this object or other object isn't persistent we call Equals(Object) (Overrides Object.Equals(Object) .) |
|  FlushTransients | Process data in transient fields (if any), do whatever is required to persist such data if needed. By default does nothing. |
|  GetDataMembers | Gets a list of the fields meta data objects |
|  GetFieldValues | Returns a list of field values of this object or returns it as an array (if this is an array) |
|  GetHashCode | Computes a hash code based on Oid of object. Make sure to persist objects before using GetHashCode() or override GetHashCode() (Overrides Object.GetHashCode() .) |
|  GetPage | Get the persistent storage Page of this object |
|  GetSession | Gets the session of this object or null if this object isn't yet persisted. |
|  GetTypeVersion | The database engine needs this internally |
|  GetWrappedObject | Internally used when IOptimizedPersistable is a wrapper for a non IOptimizedPersistable |
|  InitializeAfterRead | This function is called when an object has been read from disk and all data members (fields) have been loaded. Override this to provide your own initializations of transient data. |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. |
|  ListToString | This is a support function for the VelocityDbBrowser |
|  OidOf | Gets the Oid (encoded as an UInt64) of a non OptimizedPersistable object or 0 if the object isn't persistent on the same page as this object. |
|  Open(UInt32, Boolean, Boolean) | Opens a persistent object located in the same Database as this object |

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Open(T)(UInt32, Boolean, Boolean) | Opens a persistent object located in the same Database as this object |
|  OptimizedPersistableFieldValues | Gets a list of all field values of the current object that are subclasses of OptimizedPersistable |
|  Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) | Persists this object. |
|  Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. |
|  PersistentVersion | Gets the page version of a persistent object |
|  PersistMyReferences | Persists references from this object |
|  ReadMe | Used by code generator |
|  ReadMeUsingSchemaReflection | Used by code generator. By default objects are read and written using persisted schema information and reflection. |
|  SetPage | Sets the persistent storage Page of this object |
|  SetTypeVersion | The database engine needs this internally |
|  ShallowCopyTo | Internal use for now |
|  ToString | Displays class name plus object id (Overrides Object.ToString() .) |
|  Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. |
|  Update() | Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! |
|  Update(Action) | Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! Add code to update object in Action parameter. |
|  UpdateNonIndexField | Marks an object as being updated so that object will be written at commit transaction. Call before updating a NON indexed field. Same as Update() but avoids deleting object from indices (if any). If updating a field used in any index, call Update() instead or you may end up with one or more corrupt indices. |
|  UpdateTypeVersion | Updates the object and make this object use the latest Type definition for its class. The object now will now adjust for data attribute changes. |
|  Write | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be |

| | | |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| | | updated. Other objects on the same page will also be written. |
|  | WriteMe | Used by code generator. |
|   | WriteMeUsingSchemaReflection | Used by code generator. This is the default way of writing objects using schema information and .NET reflection info. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

OptimizedPersistable.Clone Method

See [MemberwiseClone\(\)](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual Object Clone ()
```

VB

```
Public Overridable Function Clone As Object
```

C++

```
public:  
virtual Object^ Clone ()
```

F#

```
abstract Clone : unit -> Object  
override Clone : unit -> Object
```

Return Value

Type: [Object](#)

A non persisted clone

Implements

[ICloneable.Clone\(\)](#)

See Also

[OptimizedPersistable Class](#)

OptimizedPersistable.CompareTo Method

Compares objects using the object [Id](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual int CompareTo(  
    Object obj  
)
```

VB

```
Public Overridable Function CompareTo (  
    obj As Object  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    Object^ obj  
)
```

F#

```
abstract CompareTo :  
    obj : Object -> int  
override CompareTo :  
    obj : Object -> int
```

Parameters

obj

Type: [System.Object](#)

[Missing <param name="obj"/> documentation for "M:VelocityDb.OptimizedPersistable.CompareTo(System.Object)"]

Return Value

Type: [Int32](#)

[Missing <returns> documentation for "M:VelocityDb.OptimizedPersistable.CompareTo(System.Object)"]

Implements

[IComparable.CompareTo\(Object\)](#)

See Also

[OptimizedPersistable Class](#)

VelocityDB Class Library

[VelocityDb Namespace](#)

OptimizedPersistable.Equals Method

Determines whether the specified Object is equal to the current Object. If this object or other object isn't persistent we call [Equals\(Object\)](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool Equals(  
    Object obj  
)
```

VB

```
Public Overrides Function Equals (  
    obj As Object  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    Object^ obj  
) override
```

F#

```
abstract Equals :  
    obj : Object -> bool  
override Equals :  
    obj : Object -> bool
```

Parameters

obj

Type: [System.Object](#)

Object to compare with

Field Value

Type: [Boolean](#)

true if the specified Object is equal to the current Object; otherwise, false.

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for "M:VelocityDb.OptimizedPersistable.Equals(System.Object)"]

[VelocityDb Namespace](#)

OptimizedPersistable.GetHashCode Method

Computes a hash code based on Oid of object. Make sure to persist objects before using GetHashCode() or override GetHashCode()

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override int GetHashCode ()
```

VB

```
Public Overrides Function GetHashCode As Integer
```

C++

```
public:  
virtual int GetHashCode () override
```

F#

```
abstract GetHashCode : unit -> int  
override GetHashCode : unit -> int
```

Return Value

Type: [Int32](#)

[Missing <returns> documentation for "M:VelocityDb.OptimizedPersistable.GetHashCode"]

Get the persistent storage [Page](#) of this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Page GetPage ()
```

VB

```
Public Function GetPage As Page
```

C++

```
public:  
virtual Page^ GetPage () sealed
```

F#

```
abstract GetPage : unit -> Page  
override GetPage : unit -> Page
```

Return Value

Type: [Page](#)

The persistent storage [Page](#) of this object

Implements

[IOptimizedPersistable.GetPage\(\)](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.GetSession Method

Gets the session of this object or null if this object isn't yet persisted.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SessionBase GetSession()
```

VB

```
Public Function GetSession As SessionBase
```

C++

```
public:  
SessionBase^ GetSession()
```

F#

```
member GetSession : unit -> SessionBase
```

Return Value

Type: [SessionBase](#)

The active [SessionBase](#) of this object

See Also

[OptimizedPersistable Class](#)

OptimizedPersistable.GetTypeVersion Method

The database engine needs this internally

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion GetTypeVersion()
```

VB

```
Public Function GetTypeVersion As TypeVersion
```

C++

```
public:  
virtual TypeVersion^ GetTypeVersion() sealed
```

F#

```
abstract GetTypeVersion : unit -> TypeVersion  
override GetTypeVersion : unit -> TypeVersion
```

Return Value

Type: [TypeVersion](#)

The [TypeVersion](#) of this object

Implements

[IOptimizedPersistable.GetTypeVersion\(\)](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.GetWrappedObject Method

Internally used when [IOptimizedPersistable](#) is a wrapper for a non [IOptimizedPersistable](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Object GetWrappedObject ()
```

VB

```
Public Function GetWrappedObject As Object
```

C++

```
public:  
virtual Object^ GetWrappedObject () sealed
```

F#

```
abstract GetWrappedObject : unit -> Object  
override GetWrappedObject : unit -> Object
```

Return Value

Type: [Object](#)

Wrapped object if set; otherwise this object

Implements

[IOptimizedPersistable.GetWrappedObject\(\)](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.InitializeAfterRead Method

This function is called when an object has been read from disk and all data members (fields) have been loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void InitializeAfterRead(  
    SessionBase session  
)
```

VB

```
Public Overridable Sub InitializeAfterRead (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRead(  
    SessionBase^ session  
)
```

F#

```
abstract InitializeAfterRead :  
    session : SessionBase -> unit  
override InitializeAfterRead :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRead\(SessionBase\)](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void InitializeAfterRecreate(  
    SessionBase session  
)
```

VB

```
Public Overridable Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRecreate(  
    SessionBase^ session  
)
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit  
override InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRecreate\(SessionBase\)](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.ListToString Method

This is a support function for the VelocityDbBrowser

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static string ListToString(  
    IList list,  
    Page page  
)
```

VB

```
Public Shared Function ListToString (  
    list As IList,  
    page As Page  
) As String
```

C++

```
public:  
static String^ ListToString(  
    IList^ list,  
    Page^ page  
)
```

F#

```
static member ListToString :  
    list : IList *  
    page : Page -> string
```

Parameters

list

Type: [System.Collections.IList](#)

A list to output as a string

page

Type: [VelocityDb.Page](#)

The page containing the list

Return Value

Type: [String](#)

A string representing the input list.

VelocityDB Class Library

[VelocityDb Namespace](#)

OptimizedPersistable.OidOf Method

Gets the Oid (encoded as an UInt64) of a non OptimizedPersistable object or 0 if the object isn't persistent on the same page as this object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong OidOf(  
    Object obj  
)
```

VB

```
Public Function OidOf (  
    obj As Object  
) As ULong
```

C++

```
public:  
unsigned long long OidOf(  
    Object^ obj  
)
```

F#

```
member OidOf :  
    obj : Object -> uint64
```

Parameters

obj

Type: [System.Object](#)

[Missing <param name="obj"/> documentation for "M:VelocityDb.OptimizedPersistable.OidOf(System.Object)"]

Return Value

Type: [UInt64](#)

[Missing <returns> documentation for "M:VelocityDb.OptimizedPersistable.OidOf(System.Object)"]

[VelocityDb Namespace](#)

OptimizedPersistable.Open Method (UInt32, Boolean, Boolean)

Opens a persistent object located in the same Database as this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Object Open(  
    uint pageSlot,  
    bool update = false,  
    bool inFlush = false  
)
```

VB

```
Public Function Open (  
    pageSlot As UInteger,  
    Optional update As Boolean = false,  
    Optional inFlush As Boolean = false  
) As Object
```

C++

```
public:  
Object^ Open(  
    unsigned int pageSlot,  
    bool update = false,  
    bool inFlush = false  
)
```

F#

```
member Open :  
    pageSlot : uint32 *  
    ?update : bool *  
    ?inFlush : bool  
(* Defaults:  
    let_update = defaultArg update false  
    let_inFlush = defaultArg inFlush false  
)  
-> Object
```

Parameters

pageSlot

Type: [System.UInt32](#)

The ObjectId encoded as a UInt32 of the object to open within the same Database as this object

update (Optional)

Type: [System.Boolean](#)

VelocityDB Class Library

Open the object for update?

inFlush (Optional)

Type: [System.Boolean](#)

if true, disallow page flushing while opening the object

Return Value

Type: [Object](#)

The opened object or `null` if it does not exist

See Also

[OptimizedPersistable Class](#)

[Open Overload](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Open(T) Method (UInt32, Boolean, Boolean)

Opens a persistent object located in the same Database as this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public T Open<T>(
    uint pageSlot,
    bool update = false,
    bool inFlush = false
)
```

VB

```
Public Function Open(Of T) (
    pageSlot As UInteger,
    Optional update As Boolean = false,
    Optional inFlush As Boolean = false
) As T
```

C++

```
public:
    generic<typename T>
    T Open(
        unsigned int pageSlot,
        bool update = false,
        bool inFlush = false
    )
```

F#

```
member Open :
    pageSlot : uint32 *
    ?update : bool *
    ?inFlush : bool
(* Defaults:
    let _update = defaultArg update false
    let _inFlush = defaultArg inFlush false
*)
-> 'T
```

Parameters

pageSlot

Type: [System.UInt32](#)

The OidShort encoded as a UInt32 of the object to open within the same Database as this object

update (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Open the object for update?

inFlush (Optional)

Type: [System.Boolean](#)

if true, disallow page flushing while opening the object

Type Parameters

T

**[Missing <typeparam name="T"/> documentation for
"M:VelocityDb.OptimizedPersistable.Open`1(System.UInt32,System.Boolean,System.Boolean)"]**

Return Value

Type: **T**

The opened object or `null` if it does not exist

OptimizedPersistable.Persist Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
|  | Persist(SessionBase, IOptimizedPersistable, Boolean, Boolean) | Persists this object. |
|  | Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)) | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. |

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Persist Method (SessionBase, IOptimizedPersistable, Boolean, Boolean)

Persists this object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ulong Persist(
    SessionBase session,
    IOptimizedPersistable placeHint,
    bool persistRefs = true,
    bool disableFlush = false
)
```

VB

```
Public Overridable Function Persist (
    session As SessionBase,
    placeHint As IOptimizedPersistable,
    Optional persistRefs As Boolean = true,
    Optional disableFlush As Boolean = false
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    SessionBase^ session,
    IOptimizedPersistable^ placeHint,
    bool persistRefs = true,
    bool disableFlush = false
)
```

F#

```
abstract Persist :
    session : SessionBase *
    placeHint : IOptimizedPersistable *
    ?persistRefs : bool *
    ?disableFlush : bool
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
*)
-> uint64
override Persist :
    session : SessionBase *
    placeHint : IOptimizedPersistable *
    ?persistRefs : bool *
    ?disableFlush : bool
```

```
(* Defaults:  
    let_persistRefs = defaultArg persistRefs true  
    let_disableFlush = defaultArg disableFlush false  
*)  
-> uint64
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

placeHint

Type: [VelocityDb.IOptimizedPersistable](#)

Use placement as specified by this object type, see [PlacementDatabaseNumber](#), [ObjectsPerPage](#) and [PagesPerDatabase](#) For best performance this should be a recently created object that you want the current object to be persisted near.

persistRefs (Optional)

Type: [System.Boolean](#)

Persist any referenced object now or delay until flush/commit

disableFlush (Optional)

Type: [System.Boolean](#)

Controls possible flushing of updated pages. Set to true if you want to prevent updated pages from being flushed to disk and setting such pages to a non updated state.

Return Value

Type: [UInt64](#)

The object id of the persistent object

Implements

[IOptimizedPersistable.Persist\(SessionBase, IOptimizedPersistable, Boolean, Boolean\)](#)

See Also

[OptimizedPersistable Class](#)

[Persist Overload](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Persist Method (Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable))

Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ulong Persist(
    Placement place,
    SessionBase session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable> toPersist = null
)
```

VB

```
Public Overridable Function Persist (
    place As Placement,
    session As SessionBase,
    Optional persistRefs As Boolean = true,
    Optional disableFlush As Boolean = false,
    Optional toPersist As Queue(Of IOptimizedPersistable) = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    Placement^ place,
    SessionBase^ session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable^>^ toPersist = nullptr
)
```

F#

```
abstract Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
```

```
-> uint64
override Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

The placement rules to follow when persisting this object

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

persistRefs (Optional)

Type: [System.Boolean](#)

If true, objects referenced from this object will also be persisted

disableFlush (Optional)

Type: [System.Boolean](#)

If true, disables possible flushing of updated pages while persisting this object; otherwise page flushing may occur

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A queue of objects remaining to be persisted. Pass as a parameter to session.Persist

Return Value

Type: [UInt64](#)

The object id of this persistent object

Implements

[IOptimizedPersistable.Persist\(Placement, SessionBase, Boolean, Boolean, Queue<IOptimizedPersistable>\)](#)

See Also

[OptimizedPersistable Class](#)

OptimizedPersistable.PersistentVersion Method

Gets the page version of a persistent object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong PersistentVersion()
```

VB

```
Public Function PersistentVersion As ULong
```

C++

```
public:  
unsigned long long PersistentVersion()
```

F#

```
member PersistentVersion : unit -> uint64
```

Return Value

Type: [UInt64](#)

The page version.

abstract PersistMyReferences :  
    session : SessionBase *  
    inFlush : bool -> unit  
override PersistMyReferences :  
    session : SessionBase *  
    inFlush : bool -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

inFlush

Type: [System.Boolean](#)

are we in a page flush

Implements

[IOptimizedPersistable.PersistMyReferences\(SessionBase, Boolean\)](#)

VelocityDB Class Library

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.ReadMeUsingSchemaReflection Method

Used by code generator. By default objects are read and written using persisted schema information and reflection.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static void ReadMeUsingSchemaReflection(
    TypeVersion typeVersion,
    byte[] memberBytes,
    ref int offset,
    IOptimizedPersistable pObj,
    SessionBase session,
    Page page,
    bool useOidShort,
    Schema schema,
    bool openRefs,
    List<IOptimizedPersistable> toLoadMembers,
    int graphDepth,
    int graphDepthToLoad,
    bool primitivesOnly
)
```

VB

```
Public Shared Sub ReadMeUsingSchemaReflection (
    typeVersion As TypeVersion,
    memberBytes As Byte(),
    ByRef offset As Integer,
    pObj As IOptimizedPersistable,
    session As SessionBase,
    page As Page,
    useOidShort As Boolean,
    schema As Schema,
    openRefs As Boolean,
    toLoadMembers As List(Of IOptimizedPersistable),
    graphDepth As Integer,
    graphDepthToLoad As Integer,
    primitivesOnly As Boolean
)
```

C++

```
public:
    static void ReadMeUsingSchemaReflection(
        TypeVersion^ typeVersion,
        array<unsigned char>^ memberBytes,
        int% offset,
        IOptimizedPersistable^ pObj,
        SessionBase^ session,
        Page^ page,
```

```
bool useOidShort,  
Schema^ schema,  
bool openRefs,  
List<IOptimizedPersistable^>^ toLoadMembers,  
int graphDepth,  
int graphDepthToLoad,  
bool primitivesOnly  
)
```

F#

```
static member ReadMeUsingSchemaReflection :  
    typeVersion : TypeVersion *  
    memberBytes : byte[] *  
    offset : int byref *  
    pObj : IOptimizedPersistable *  
    session : SessionBase *  
    page : Page *  
    useOidShort : bool *  
    schema : Schema *  
    openRefs : bool *  
    toLoadMembers : List<IOptimizedPersistable> *  
    graphDepth : int *  
    graphDepthToLoad : int *  
    primitivesOnly : bool -> unit
```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

Version of a type

memberBytes

Type: [System.Byte\[\]](#)

Bytes containing object to read

offset

Type: [System.Int32](#)

Offset into memberBytes

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object being read in

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

page

Type: [VelocityDb.Page](#)

Page of object being read

VelocityDB Class Library

useOidShort

Type: [System.Boolean](#)

Does object use short object references (32bit)?

schema

Type: [VelocityDb.TypeInfo.Schema](#)

Schema information

openRefs

Type: [System.Boolean](#)

Shall references from object also be filled in now

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

Members remaining to be read

graphDepth

Type: [System.Int32](#)

Current graph depth read

graphDepthToLoad

Type: [System.Int32](#)

Stop reading at this graph depth

primitivesOnly

Type: [System.Boolean](#)

[Missing <param name="primitivesOnly"/> documentation for

"M:VelocityDb.OptimizedPersistable.ReadMeUsingSchemaReflection(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.IOptimizedPersistable,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

OptimizedPersistable.SetPage Method

Sets the persistent storage [Page](#) of this object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SetPage (  
    Page page  
)
```

VB

```
Public Sub SetPage (  
    page As Page  
)
```

C++

```
public:  
virtual void SetPage (  
    Page^ page  
) sealed
```

F#

```
abstract SetPage :  
    page : Page -> unit  
override SetPage :  
    page : Page -> unit
```

Parameters

page

Type: [VelocityDb.Page](#)

A persistent storage [Page](#)

Implements

[IOptimizedPersistable.SetPage\(Page\)](#)

See Also

[OptimizedPersistable Class](#)

OptimizedPersistable.SetTypeVersion Method

The database engine needs this internally

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SetTypeVersion(  
    TypeVersion typeVersion  
)
```

VB

```
Public Sub SetTypeVersion (  
    typeVersion As TypeVersion  
)
```

C++

```
public:  
virtual void SetTypeVersion(  
    TypeVersion^ typeVersion  
) sealed
```

F#

```
abstract SetTypeVersion :  
    typeVersion : TypeVersion -> unit  
override SetTypeVersion :  
    typeVersion : TypeVersion -> unit
```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

[Missing <param name="typeVersion"/> documentation for "M:VelocityDb.OptimizedPersistable.SetTypeVersion(VelocityDb.TypeInfo.TypeVersion)"]

Implements

[IOptimizedPersistable.SetTypeVersion\(TypeVersion\)](#)

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.ShallowCopyTo Method

Internal use for now

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IOptimizedPersistable ShallowCopyTo(  
    Page page  
)
```

VB

```
Public Function ShallowCopyTo (  
    page As Page  
) As IOptimizedPersistable
```

C++

```
public:  
virtual IOptimizedPersistable^ ShallowCopyTo(  
    Page^ page  
) sealed
```

F#

```
abstract ShallowCopyTo :  
    page : Page -> IOptimizedPersistable  
override ShallowCopyTo :  
    page : Page -> IOptimizedPersistable
```

Parameters

page

Type: [VelocityDb.Page](#)

[Missing <param name="page"/> documentation for "M:VelocityDb.OptimizedPersistable.ShallowCopyTo(VelocityDb.Page)"]

Return Value

Type: [IOptimizedPersistable](#)

[Missing <returns> documentation for "M:VelocityDb.OptimizedPersistable.ShallowCopyTo(VelocityDb.Page)"]

Implements

[IOptimizedPersistable.ShallowCopyTo\(Page\)](#)

[OptimizedPersistable Class](#)

VelocityDB Class Library

[VelocityDb Namespace](#)

OptimizedPersistable.ToString Method

Displays class name plus object id

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override string ToString()
```

VB

```
Public Overrides Function ToString As String
```

C++

```
public:  
virtual String^ ToString() override
```

F#

```
abstract ToString : unit -> string  
override ToString : unit -> string
```

Return Value

Type: [String](#)

A [String](#) containing class name and object id.

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overridable Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
)
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Update Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Update() | Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! |
|  | Update(Action) | Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! Add code to update object in Action parameter. |

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Update Method

Marks an object as being updated so that object will be written at commit transaction. Call before making object changes!

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Update ()
```

VB

```
Public Function Update As Boolean
```

C++

```
public:  
virtual bool Update () sealed
```

F#

```
abstract Update : unit -> bool  
override Update : unit -> bool
```

Return Value

Type: [Boolean](#)

true if update successful

Implements

[IOptimizedPersistable.Update\(\)](#)

See Also

[OptimizedPersistable Class](#)

[Update Overload](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Update Method (Action)

Marks an object as being updated so that object will be written at commit transaction. Call before making object changes! Add code to update object in [Action](#) parameter.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Update(  
    Action codeBlock  
)
```

VB

```
Public Function Update (  
    codeBlock As Action  
) As Boolean
```

C++

```
public:  
bool Update(  
    Action^ codeBlock  
)
```

F#

```
member Update :  
    codeBlock : Action -> bool
```

Parameters

codeBlock

Type: [System.Action](#)

Block of code doing actual update to the object

Return Value

Type: [Boolean](#)

true if update successful

See Also

[OptimizedPersistable Class](#)

[Update Overload](#)

[VelocityDb Namespace](#)

OptimizedPersistable.UpdateNonIndexField Method

Marks an object as being updated so that object will be written at commit transaction. Call before updating a NON indexed field. Same as [Update\(\)](#) but avoids deleting object from indices (if any). If updating a field used in any index, call [Update\(\)](#) instead or you may end up with one or more corrupt indices.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool UpdateNonIndexField()
```

VB

```
Public Function UpdateNonIndexField As Boolean
```

C++

```
public:  
bool UpdateNonIndexField()
```

F#

```
member UpdateNonIndexField : unit -> bool
```

Return Value

Type: [Boolean](#)

true if update successful

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.UpdateTypeVersion Method

Updates the object and make this object use the latest Type definition for its class. The object now will now adjust for data attribute changes.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void UpdateTypeVersion ()
```

VB

```
Public Sub UpdateTypeVersion
```

C++

```
public:  
void UpdateTypeVersion ()
```

F#

```
member UpdateTypeVersion : unit -> unit
```

See Also

[OptimizedPersistable Class](#)

[VelocityDb Namespace](#)

OptimizedPersistable.Write Method

By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page will also be written.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Write()
```

VB

```
Public Sub Write
```

C++

```
public:  
void Write()
```

F#

```
member Write : unit -> unit
```

OptimizedPersistable.WriteMeUsingSchemaReflection Method

Used by code generator. This is the default way of writing objects using schema information and .NET reflection info.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static byte[] WriteMeUsingSchemaReflection(
    TypeVersion typeVersion,
    IOptimizedPersistable pObj,
    bool addShapeNumber,
    PageInfo pageInfo,
    IOptimizedPersistable owner,
    SessionBase session,
    bool inFlush
)
```

VB

```
Public Shared Function WriteMeUsingSchemaReflection (
    typeVersion As TypeVersion,
    pObj As IOptimizedPersistable,
    addShapeNumber As Boolean,
    pageInfo As PageInfo,
    owner As IOptimizedPersistable,
    session As SessionBase,
    inFlush As Boolean
) As Byte()
```

C++

```
public:
static array<unsigned char>^ WriteMeUsingSchemaReflection(
    TypeVersion^ typeVersion,
    IOptimizedPersistable^ pObj,
    bool addShapeNumber,
    PageInfo^ pageInfo,
    IOptimizedPersistable^ owner,
    SessionBase^ session,
    bool inFlush
)
```

F#

```
static member WriteMeUsingSchemaReflection :
    typeVersion : TypeVersion *
    pObj : IOptimizedPersistable *
    addShapeNumber : bool *
    pageInfo : PageInfo *
    owner : IOptimizedPersistable *
    session : SessionBase *
```

```
inFlush : bool -> byte[]
```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

The version of the type being read

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object being written

addShapeNumber

Type: [System.Boolean](#)

Shall we include bytes containing the type version of the object?

pageInfo

Type: [VelocityDb.PageInfo](#)

PageInfo for the current page

owner

Type: [VelocityDb.IOptimizedPersistable](#)

Owner of object being written

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

inFlush

Type: [System.Boolean](#)

Is page flushing OK while preparing this object to be written?

Return Value

Type: [Byte\[\]](#)

Bytes of this object

Page Class

Each [Database](#) consist of a number of variable sized pages. A page can be compressed and may be encrypted and contains one or more objects. Page compression is controlled by the [DatabaseLocation](#) of the [Database](#) containing a page. Each page has a [PageInfo](#) that provides info about a page and can be updated to turn on/off compression and encryption for a specific page.

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class Page : IComparable<Page>, IEnumerable<IOptimizedPersistable>,
    IEnumerable, IDisposable
```

VB

```
Public Class Page
    Implements IComparable(Of Page), IEnumerable(Of IOptimizedPersistable),
    IEnumerable, IDisposable
```

C++

```
public ref class Page : IComparable<Page^>,
    IEnumerable<IOptimizedPersistable^>, IEnumerable, IDisposable
```

F#

```
type Page =
    class
        interface IComparable<Page>
        interface IEnumerable<IOptimizedPersistable>
        interface IEnumerable
        interface IDisposable
    end
```

The **Page** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------|--------------------------------------------------------|
|  | Page | Internal use and usage in VelocityDbExteanions project |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------|
|  | ByteCount | |
|  | Database | The Database of this Page. |
|  | Id | The Oid (encoded as UInt64) of this page |
|  | IsUpdated | Is this Page updated? |
|  | Offset | Current page version starts at this offset in containing Database . |
|  | Oid | The Oid of this page |
|  | OnlyStub | Is this Page fully read into memory or just the PageInfo? |
|  | PageInfo | Gets the PageInfo for this Page |
|  | PageNumber | The page number of this Page in the containing Database |
|  | ShortId | The OidShort (encoded as UInt32) of this page |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|  | ClearCachedObjects | Clears all objects cached on the page but does not clear objects cached by weak references. |
|  | CompareTo | Compares Pages by PageNumber |
|  | DeleteObject | Use this as an alternative to Unpersist(SessionBase) or when using the interface class IOptimizedPersistable |
|  | Dispose | Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. |
|  | FinishUpCsvImport | Schema page requires special handling in Import from CSV files |
|  | GetEnumerator | Enumerates all objects on this Page |
|  | ObjectsLazyLoaded | Enumerates all objects on this Page. Object graph loaded up to specified max depth. |
|  | PageShortIds | Enumerates all objects short ids on this Page |
|  | Slot | Retrieves an object from persistent storage |
|  | StringToByteArray | Converts a string into an UTF8 encoded byte array |
|  | ToString | Returns a string that represents the current object. (Overrides Object.ToString() .) |
|  | UnpersistObject | Use this as an alternative to Unpersist(SessionBase) or when using the interface class IOptimizedPersistable |

Page Constructor

Internal use and usage in VelocityDbExtensions project

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Page(  
    Database db,  
    ushort pageNumber,  
    uint shapeNumber,  
    ushort objectsPerPage,  
    bool doCache = true  
)
```

VB

```
Public Sub New (  
    db As Database,  
    pageNumber As UShort,  
    shapeNumber As UInteger,  
    objectsPerPage As UShort,  
    Optional doCache As Boolean = true  
)
```

C++

```
public:  
Page(  
    Database^ db,  
    unsigned short pageNumber,  
    unsigned int shapeNumber,  
    unsigned short objectsPerPage,  
    bool doCache = true  
)
```

F#

```
new :  
    db : Database *  
    pageNumber : uint16 *  
    shapeNumber : uint32 *  
    objectsPerPage : uint16 *  
    ?doCache : bool  
(* Defaults:  
    let _doCache = defaultArg doCache true  
*)  
-> Page
```

Parameters

db

Type: [VelocityDb.Database](#)
[Database](#)

this [Page](#) belongs to

pageNumber

Type: [System.UInt16](#)

Page number of this page

shapeNumber

Type: [System.UInt32](#)

Short Id of object schema type if page contains just a single type of objects

objectsPerPage

Type: [System.UInt16](#)

Max how many objects to store on this page

doCache (Optional)

Type: [System.Boolean](#)

Cache this page in its database?

Page.Page Properties

The [Page](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------|
|  | ByteCount | |
|  | Database | The Database of this Page. |
|  | Id | The Oid (encoded as UInt64) of this page |
|  | IsUpdated | Is this Page updated? |
|  | Offset | Current page version starts at this offset in conatining Database . |
|  | Oid | The Oid of this page |
|  | OnlyStub | Is this Page fully read into memory or just the PageInfo? |
|  | PageInfo | Gets the PageInfo for this Page |
|  | PageNumber | The page number of this Page in the containing Database |
|  | ShortId | The OidShort (encoded as UInt32) of this page |

Page.Oid Property

The Oid of this page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Oid Oid { get; }
```

VB

```
Public ReadOnly Property Oid As Oid  
    Get
```

C++

```
public:  
property Oid Oid {  
    Oid get ();  
}
```

F#

```
member Oid : Oid with get
```

Property Value

Type: [Oid](#)

Page.PageInfo Property

Gets the PageInfo for this Page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public PageInfo PageInfo { get; }
```

VB

```
Public ReadOnly Property PageInfo As PageInfo  
    Get
```

C++

```
public:  
property PageInfo^ PageInfo {  
    PageInfo^ get ();  
}
```

F#

```
member PageInfo : PageInfo with get
```

Property Value

Type: [PageInfo](#)

See Also

[Page Class](#)

Page.PageNumber Property

The page number of this Page in the containing [Database](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort PageNumber { get; }
```

VB

```
Public ReadOnly Property PageNumber As UShort  
    Get
```

C++

```
public:  
property unsigned short PageNumber {  
    unsigned short get ();  
}
```

F#

```
member PageNumber : uint16 with get
```

Property Value

Type: [UInt16](#)

Page.Page Methods

The [Page](#) type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|  | ClearCachedObjects | Clears all objects cached on the page but does not clear objects cached by weak references. |
|  | CompareTo | Compares Pages by PageNumber |
|  | DeleteObject | Use this as an alternative to Unpersist(SessionBase) or when using the interface class IOptimizedPersistable |
|  | Dispose | Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. |
|  | FinishUpCsvImport | Schema page requires special handling in Import from CSV files |
|  | GetEnumerator | Enumerates all objects on this Page |
|  | ObjectsLazyLoaded | Enumerates all objects on this Page. Object graph loaded up to specified max depth. |
|  | PageShortIds | Enumerates all objects short ids on this Page |
|  | Slot | Retrieves an object from persistent storage |
|  | StringToByteArray | Converts a string into an UTF8 encoded byte array |
|  | ToString | Returns a string that represents the current object. (Overrides Object.ToString() .) |
|  | UnpersistObject | Use this as an alternative to Unpersist(SessionBase) or when using the interface class IOptimizedPersistable |

Page.ClearCachedObjects Method

Clears all objects cached on the page but does not clear objects cached by weak references.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort ClearCachedObjects(  
    SessionBase session  
)
```

VB

```
Public Function ClearCachedObjects (  
    session As SessionBase  
) As UShort
```

C++

```
public:  
unsigned short ClearCachedObjects(  
    SessionBase^ session  
)
```

F#

```
member ClearCachedObjects :  
    session : SessionBase -> uint16
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

Return Value

Type: [UInt16](#)

[Missing <returns> documentation for "M:VelocityDb.Page.ClearCachedObjects(VelocityDb.Session.SessionBase)"]

See Also

[Page Class](#)

[VelocityDb Namespace](#)

Page.CompareTo Method

Compares Pages by PageNumber

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int CompareTo(  
    Page otherPage  
)
```

VB

```
Public Function CompareTo (  
    otherPage As Page  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    Page^ otherPage  
) sealed
```

F#

```
abstract CompareTo :  
    otherPage : Page -> int  
override CompareTo :  
    otherPage : Page -> int
```

Parameters

otherPage

Type: [VelocityDb.Page](#)

The Page to compare with

Return Value

Type: [Int32](#)

-1 if this PageNumber is less than obj.PageNumber, 0 if equal and 1 if greater than

Implements

[IComparable\(T\).CompareTo\(T\)](#)

See Also

[Page Class](#)

Page.DeleteObject Method

Use this as an alternative to [Unpersist\(SessionBase\)](#) or when using the interface class [IOptimizedPersistable](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void DeleteObject (  
    ulong id  
)
```

VB

```
Public Sub DeleteObject (  
    id As ULong  
)
```

C++

```
public:  
void DeleteObject (  
    unsigned long long id  
)
```

F#

```
member DeleteObject :  
    id : uint64 -> unit
```

Parameters

id

Type: [System.UInt64](#)

The object Id of the object to be deleted

See Also

[Page Class](#)

[VelocityDb Namespace](#)

Page.Dispose Method

Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Dispose ()
```

VB

```
Public Sub Dispose
```

C++

```
public:  
virtual void Dispose () sealed
```

F#

```
abstract Dispose : unit -> unit  
override Dispose : unit -> unit
```

Implements

[IDisposable.Dispose\(\)](#)

See Also

[Page Class](#)

Page.FinishUpCsvImport Method

Schema page requires special handling in Import from CSV files

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void FinishUpCsvImport ()
```

VB

```
Public Sub FinishUpCsvImport
```

C++

```
public:  
void FinishUpCsvImport ()
```

F#

```
member FinishUpCsvImport : unit -> unit
```

[Page Class](#)

[VelocityDb Namespace](#)

Page.GetEnumerator Method

Enumerates all objects on this Page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerator<IOptimizedPersistable> GetEnumerator ()
```

VB

```
Public Function GetEnumerator As IEnumerator(Of IOptimizedPersistable)
```

C++

```
public:  
virtual IEnumerator<IOptimizedPersistable^> GetEnumerator () sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerator<IOptimizedPersistable>  
override GetEnumerator : unit -> IEnumerator<IOptimizedPersistable>
```

Return Value

Type: [IEnumerator<IOptimizedPersistable>](#)

Enumeration of all slots on this Page

Implements

[IEnumerable\(T\).GetEnumerator\(\)](#)

See Also

[Page Class](#)

[VelocityDb Namespace](#)

Page.ObjectsLazyLoaded Method

Enumerates all objects on this Page. Object graph loaded up to specified max depth.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable<IOptimizedPersistable> ObjectsLazyLoaded(  
    int depthToLoad = 0  
)
```

VB

```
Public Function ObjectsLazyLoaded (  
    Optional depthToLoad As Integer = 0  
) As IEnumerable(Of IOptimizedPersistable)
```

C++

```
public:  
IEnumerable<IOptimizedPersistable^>^ ObjectsLazyLoaded(  
    int depthToLoad = 0  
)
```

F#

```
member ObjectsLazyLoaded :  
    ?depthToLoad : int  
(* Defaults:  
    let _depthToLoad = defaultArg depthToLoad 0  
*)  
-> IEnumerable<IOptimizedPersistable>
```

Parameters

depthToLoad (Optional)

Type: [System.Int32](#)

Max how many levels deep to load each object

Return Value

Type: [IEnumerable\(IOptimizedPersistable\)](#)

Enumeration of all slots on this Page

See Also

[Page Class](#)

[VelocityDb Namespace](#)

Page.PageShortIds Method

Enumerates all objects short ids on this Page

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable<uint> PageShortIds ()
```

VB

```
Public Function PageShortIds As IEnumerable (Of UInteger)
```

C++

```
public:  
IEnumerable<unsigned int>^ PageShortIds ()
```

F#

```
member PageShortIds : unit -> IEnumerable<uint32>
```

Return Value

Type: [IEnumerable\(UInt32\)](#)

Enumeration of all slot short ids on this Page

See Also

[Page Class](#)

[VelocityDb Namespace](#)

Page.Slot Method

Retrieves an object from persistent storage

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IOptimizedPersistable Slot(
    ulong oid,
    bool openRefs,
    SessionBase session,
    Schema schema,
    bool iteration,
    List<IOptimizedPersistable> toLoadMembers,
    int graphDepth,
    int graphDepthToLoad = 2147483647,
    TypeVersion shape = null
)
```

VB

```
Public Function Slot (
    oid As ULong,
    openRefs As Boolean,
    session As SessionBase,
    schema As Schema,
    iteration As Boolean,
    toLoadMembers As List(Of IOptimizedPersistable),
    graphDepth As Integer,
    Optional graphDepthToLoad As Integer = 2147483647,
    Optional shape As TypeVersion = Nothing
) As IOptimizedPersistable
```

C++

```
public:
IOptimizedPersistable^ Slot(
    unsigned long long oid,
    bool openRefs,
    SessionBase^ session,
    Schema^ schema,
    bool iteration,
    List<IOptimizedPersistable^>^ toLoadMembers,
    int graphDepth,
    int graphDepthToLoad = 2147483647,
    TypeVersion^ shape = nullptr
)
```

F#

```
member Slot :
    oid : uint64 *
```

VelocityDB Class Library

```
    openRefs : bool *
    session : SessionBase *
    schema : Schema *
    iteration : bool *
    toLoadMembers : List<IOptimizedPersistable> *
    graphDepth : int *
    ?graphDepthToLoad : int *
    ?shape : TypeVersion
(* Defaults:
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
    let_shape = defaultArg shape null
*)
-> IOptimizedPersistable
```

Parameters

oid

Type: [System.UInt64](#)

Id of object to retrieve

openRefs

Type: [System.Boolean](#)

Shall we open references from this object?

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active schema

iteration

Type: [System.Boolean](#)

Is this called as part of an iteration

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

List of members to load

graphDepth

Type: [System.Int32](#)

The current load graph depth

graphDepthToLoad (Optional)

Type: [System.Int32](#)

Max graph depth to load

shape (Optional)

Type: [VelocityDb.TypeInfo.TypeVersion](#)

VelocityDB Class Library

The type version of the object to retrieve

Return Value

Type: [IOptimizedPersistable](#)

The retrieved object

See Also

Page.StringToByteArray Method

Converts a string into an UTF8 encoded byte array

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static byte[] StringToByteArray(  
    string str  
)
```

VB

```
Public Shared Function StringToByteArray (  
    str As String  
) As Byte()
```

C++

```
public:  
static array<unsigned char>^ StringToByteArray(  
    String^ str  
)
```

F#

```
static member StringToByteArray :  
    str : string -> byte[]
```

Parameters

str

Type: [System.String](#)

a string to convert

Return Value

Type: [Byte\[\]](#)

a UTF8 encoding

See Also

[Page Class](#)

[VelocityDb Namespace](#)

Page.ToString Method

Returns a string that represents the current object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override string ToString()
```

VB

```
Public Overrides Function ToString As String
```

C++

```
public:  
virtual String^ ToString() override
```

F#

```
abstract ToString : unit -> string  
override ToString : unit -> string
```

Return Value

Type: [String](#)

A string that represents the current object.

See Also

Page.UnpersistObject Method

Use this as an alternative to [Unpersist\(SessionBase\)](#) or when using the interface class [IOptimizedPersistable](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void UnpersistObject (
    IOptimizedPersistable pObj
)
```

VB

```
Public Sub UnpersistObject (
    pObj As IOptimizedPersistable
)
```

C++

```
public:
void UnpersistObject (
    IOptimizedPersistable^ pObj
)
```

F#

```
member UnpersistObject :
    pObj : IOptimizedPersistable -> unit
```

Parameters

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to be unpersisted

See Also

PageCache Class

Maintains string references to [Pages](#) within a [Database](#)

Inheritance Hierarchy

[System.Object](#)

VelocityDb.PageCache

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class PageCache : IEnumerable<Page>,
    IEnumerable
```

VB

```
Public Class PageCache
    Implements IEnumerable(Of Page), IEnumerable
```

C++

```
public ref class PageCache : IEnumerable<Page^>,
    IEnumerable
```

F#

```
type PageCache =
    class
        interface IEnumerable<Page>
        interface IEnumerable
    end
```

The **PageCache** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------|-------------------------------------|
|  | Item | Get or set a page in the page cache |
|  | Length | Max number of pages in page cache |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|----------------------------------------------------------------|
|  | GetEnumerator | Enumeration of all objects of the cached Pages |

[PageCache Class](#)

[VelocityDb Namespace](#)

PageCache.Item Property

Get or set a page in the page cache

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Page this[
    ushort pageNumber
] { get; set; }
```

VB

```
Public Default Property Item (
    pageNumber As UShort
) As Page
    Get
    Set
```

C++

```
public:
property Page^ default[unsigned short pageNumber] {
    Page^ get (unsigned short pageNumber);
    void set (unsigned short pageNumber, Page^ value);
}
```

F#

```
member Item : Page with get, set
```

Parameters

pageNumber

Type: [System.UInt16](#)

Page number within a database for requested page

Return Value

Type: [Page](#)

A page if it exist in the page cache

See Also

[PageCache Class](#)

[VelocityDb Namespace](#)

PageCache.Length Property

Max number of pages in page cache

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int Length { get; }
```

VB

```
Public ReadOnly Property Length As Integer  
    Get
```

C++

```
public:  
property int Length {  
    int get ();  
}
```

F#

```
member Length : int with get
```

Property Value

Type: [Int32](#)

See Also

[PageCache Class](#)

[VelocityDb Namespace](#)

PageCache.PageCache Methods

The [PageCache](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|----------------------------------------------------------------|
|  | GetEnumerator | Enumeration of all objects of the cached Pages |

See Also

[PageCache Class](#)

[VelocityDb Namespace](#)

PageCache.GetEnumerator Method

Enumeration of all objects of the cached [Pages](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerator GetEnumerator()
```

VB

```
Public Function GetEnumerator As IEnumerator
```

C++

```
public:  
virtual IEnumerator^ GetEnumerator() sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerator  
override GetEnumerator : unit -> IEnumerator
```

Return Value

Type: [IEnumerator](#)

The enumeration

Implements

[IEnumerable.GetEnumerator\(\)](#)

See Also

[PageCache Class](#)

[VelocityDb Namespace](#)

PageInfo Class

Each [Page](#) has a PageInfo that provides info about a page and can be used to turn on/off compression and encryption for a page.

Inheritance Hierarchy

[System.Object](#)

VelocityDb.PageInfo

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#
public class PageInfo
```

```
VB
Public Class PageInfo
```

```
C++
public ref class PageInfo
```

```
F#
type PageInfo = class end
```

The **PageInfo** type exposes the following members.

Properties

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
|  Compressed | A Page can be compressed or not. |
|  Encryption | A Page can be encrypted with DES or not. |
|  FirstFreeSlot | The first available page on the Page . |
|  NoFreeSlotInBetweenInUseSlots | Is there no gaps of unused slots in between the in use slots (all contiguous in use slots)? |
|  NumberOfSlots | The number of objects/slots on the Page . |
|  OnDiskSize | The byte size of the Page when it was last written to disk. |
|  ShapeNumber | If non 0, all objects on the page have the same Type. |
|  UncompressedSize | The byte size of the Page when it was last written to disk (before any compression was applied). |
|  VersionNumber | Each Page gets its page version incremented in every transaction where the it is updated. |

Fields

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------|-----------------------------------------------------------------------------|
|  | s_pageInfoByteCount | The size of the PageInfo at the start of each Page . |
|  | s_pageInfoByteCountV1 | |

[VelocityDb Namespace](#)

PageInfo.Compressed Property

A [Page](#) can be compressed or not.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public PageInfo.compressionKind Compressed { get; set; }
```

VB

```
Public Property Compressed As PageInfo.compressionKind  
    Get  
    Set
```

C++

```
public:  
property PageInfo.compressionKind Compressed {  
    PageInfo.compressionKind get ();  
    void set (PageInfo.compressionKind value);  
}
```

F#

```
member Compressed : PageInfo.compressionKind with get, set
```

Property Value

Type: [PageInfo.compressionKind](#)

The [Boolean](#)

See Also

PageInfo.Encryption Property

A [Page](#) can be encrypted with DES or not.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public PageInfo.encryptionKind Encryption { get; set; }
```

VB

```
Public Property Encryption As PageInfo.encryptionKind  
    Get  
    Set
```

C++

```
public:  
property PageInfo.encryptionKind Encryption {  
    PageInfo.encryptionKind get ();  
    void set (PageInfo.encryptionKind value);  
}
```

F#

```
member Encryption : PageInfo.encryptionKind with get, set
```

Property Value

Type: [PageInfo.encryptionKind](#)

The [PageInfo.encryptionKind](#)

See Also

PageInfo.NoFreeSlotInBetweenInUseSlots Property

Is there no gaps of unused slots in between the in use slots (all contiguous in use slots)?

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool NoFreeSlotInBetweenInUseSlots { get; }
```

VB

```
Public ReadOnly Property NoFreeSlotInBetweenInUseSlots As Boolean  
    Get
```

C++

```
public:  
property bool NoFreeSlotInBetweenInUseSlots {  
    bool get ();  
}
```

F#

```
member NoFreeSlotInBetweenInUseSlots : bool with get
```

Property Value

Type: [Boolean](#)

See Also

[PageInfo Class](#)

[VelocityDb Namespace](#)

PageInfo.NumberOfSlots Property

The number of objects/slots on the [Page](#).

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort NumberOfSlots { get; set; }
```

VB

```
Public Property NumberOfSlots As UShort  
    Get  
    Set
```

C++

```
public:  
property unsigned short NumberOfSlots {  
    unsigned short get ();  
    void set (unsigned short value);  
}
```

F#

```
member NumberOfSlots : uint16 with get, set
```

Property Value

Type: [UInt16](#)

The [UInt16](#) of objects/slots on the page

See Also

[VelocityDb Namespace](#)

PageInfo.OnDiskSize Property

The byte size of the [Page](#) when it was last written to disk.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint OnDiskSize { get; }
```

VB

```
Public ReadOnly Property OnDiskSize As UInteger  
    Get
```

C++

```
public:  
property unsigned int OnDiskSize {  
    unsigned int get ();  
}
```

F#

```
member OnDiskSize : uint32 with get
```

Property Value

Type: [UInt32](#)

The [UInt32](#) of bytes

See Also

[PageInfo Class](#)

[VelocityDb Namespace](#)

PageInfo.ShapeNumber Property

If non 0, all objects on the page have the same Type.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint ShapeNumber { get; }
```

VB

```
Public ReadOnly Property ShapeNumber As UInteger  
    Get
```

C++

```
public:  
property unsigned int ShapeNumber {  
    unsigned int get ();  
}
```

F#

```
member ShapeNumber : uint32 with get
```

Property Value

Type: [UInt32](#)

See Also

PageInfo.VersionNumber Property

Each [Page](#) gets its page version incremented in every transaction where the it is updated.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong VersionNumber { get; set; }
```

VB

```
Public Property VersionNumber As ULong  
    Get  
    Set
```

C++

```
public:  
property unsigned long long VersionNumber {  
    unsigned long long get ();  
    void set (unsigned long long value);  
}
```

F#

```
member VersionNumber : uint64 with get, set
```

Property Value

Type: [UInt64](#)

The current [UInt64](#) page version

PageInfo.encryptedKind Enumeration

Use **desEncrypted** for encrypted pages, set encryption private key in [DatabaseLocation](#). Use **noEncryption** when no encryption is desired. Other choices in this enum are not yet publicly available. Other kinds of encryption can be provided upon request. We can even make the interface public allowing application defined encryption.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public enum encryptionKind
```

VB

```
Public Enumeration encryptionKind
```

C++

```
public enum class encryptionKind
```

F#

```
type encryptionKind
```

Members

| Member name | Value | Description |
|-------------------------|-------|------------------------------------------------------------------------------------|
| noEncryption | 0 | No Page encryption |
| desEncrypted | 1 | Use DES Page encryption |
| rsaEncrypted2048 | 2 | Use RSA 2048bits Page encryption (not yet made publicly available) |
| rsaSigned2048 | 3 | Use RSA 2048bits Page signing (not yet made publicly available) |

PageOffset Class

Internally Used within VelocityDB and its extensions

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.PageOffset

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class PageOffset : OptimizedPersistable
```

VB

```
<SerializableAttribute>  
Public Class PageOffset  
    Inherits OptimizedPersistable
```

C++

```
[SerializableAttribute]  
public ref class PageOffset : public OptimizedPersistable
```

F#

```
[<SerializableAttribute>]  
type PageOffset =  
    class  
        inherit OptimizedPersistable  
    end
```

The **PageOffset** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------|-----------------------------------------------------------|
|  | PageOffset(UInt16) | Initializes a new instance of the PageOffset class |
|  | PageOffset(SessionBase) | Initializes a new instance of the PageOffset class |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------|-------------|
|  | Count | |

| | | |
|-----------------------------------------------------------------------------------|-----------------------------------|--|
|  | HighestPageNumber | |
|  | InOffsetOrder | |
|  | Item | |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Add | |
|  | OffsetLookup | |
|  | ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  | Remove | |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

PageOffset Constructor (UInt16)

Initializes a new instance of the [PageOffset](#) class

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public PageOffset(  
    ushort preSize = 1000  
)
```

VB

```
Public Sub New (  
    Optional preSize As UShort = 1000  
)
```

C++

```
public:  
PageOffset(  
    unsigned short preSize = 1000  
)
```

F#

```
new :  
    ?preSize : uint16  
(* Defaults:  
    let_preSize = defaultArg preSize 1000  
)  
-> PageOffset
```

Parameters

preSize (Optional)

Type: [System.UInt16](#)

[Missing <param name="preSize"/> documentation for "M:VelocityDb.PageOffset.#ctor(System.UInt16)"]

```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

[Missing <param name="typeVersion"/> documentation for

"M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

memberBytes

Type: [System.Byte\[\]](#)

[Missing <param name="memberBytes"/> documentation for

"M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,V

elocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

offset

Type: [System.Int32](#)

[Missing <param name="offset"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

page

Type: [VelocityDb.Page](#)

[Missing <param name="page"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

useOidShort

Type: [System.Boolean](#)

[Missing <param name="useOidShort"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

schema

Type: [VelocityDb.TypeInfo.Schema](#)

[Missing <param name="schema"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

openRefs

Type: [System.Boolean](#)

[Missing <param name="openRefs"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

[Missing <param name="toLoadMembers"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

graphDepth

Type: [System.Int32](#)

[Missing <param name="graphDepth"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

graphDepthToLoad

Type: [System.Int32](#)

[Missing <param name="graphDepthToLoad"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

primitivesOnly

Type: [System.Boolean](#)

[Missing <param name="primitivesOnly"/> documentation for "M:VelocityDb.PageOffset.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

Implements

[IOptimizedPersistable.ReadMe\(TypeVersion,Byte\[\], Int32, SessionBase, Page, Boolean, Schema, Boolean, List<IOptimizedPersistable>, Int32, Int32, Boolean\)](#)

PageOffset.Remove Method

[Missing <summary> documentation for "M:VelocityDb.PageOffset.Remove(System.UInt16)"]

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Remove(  
    ushort pageNumber  
)
```

VB

```
Public Function Remove (  
    pageNumber As UShort  
) As Boolean
```

C++

```
public:  
bool Remove(  
    unsigned short pageNumber  
)
```

F#

```
member Remove :  
    pageNumber : uint16 -> bool
```

Parameters

pageNumber

Type: [System.UInt16](#)

[Missing <param name="pageNumber"/> documentation for "M:VelocityDb.PageOffset.Remove(System.UInt16)"]

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for "M:VelocityDb.PageOffset.Remove(System.UInt16)"]

Placement Class

This class is used when deciding where to place a new object persistently. That is we have a choice of database number, page number and page number. There is other ways to control the placement including [ObjectsPerPage](#), [PagesPerDatabase](#), and it is also possible to override [Persist\(Placement, SessionBase, Boolean, Boolean, Queue\(IOptimizedPersistable\)\)](#).

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Placement

[VelocityDb.AutoPlacement](#)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class Placement : OptimizedPersistable
```

VB

```
<SerializableAttribute>
Public Class Placement
    Inherits OptimizedPersistable
```

C++

```
[SerializableAttribute]
public ref class Placement : public OptimizedPersistable
```

F#

```
[<SerializableAttribute>]
type Placement =
    class
        inherit OptimizedPersistable
    end
```

The **Placement** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
|  | Placement(SessionBase, IOptimizedPersistable, IOptimizedPersistable, Boolean, UInt32, Boolean) | Creates a Placement used for choosing a place to persist objects |
|  | Placement(UInt32, UInt16, UInt16, UInt16, UInt16, Boolean, Boolean, UInt32, Boolean, Boolean) | Creates a Placement used for choosing a place to persist objects |

Properties

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Gets/sets permission to create multiple types on the same page. |
|  EndDatabaseNumber | The last Database number acceptable for placement |
|  MaxObjectsPerPage | Gets/Sets the limit on how many objects to create on a single page. |
|  MaxPagesPerDatabase | Gets/sets the limit on the number of pages per database. |
|  StartDatabaseNumber | The first/original Database number used by this Placement |
|  StartPageNumber | The first/original Page number used by this Placement |
|  TryDatabaseNumber | Gets the current Database number to try with first for object placement. |
|  TryPageNumber | Gets/sets the page number to try with first when persisting a new object. |
|  TrySlotNumber | Gets/sets the page number to try next when persisting an object. |

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  IncrementTryDatabaseNumber | Incremnts the Database number used when placing (persisting) objects |
|  IncrementTryPageNumber | Increments the tryPageNumber by 1 |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |

Fields

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
|  DefaultPlacementDatabaseNumber | If no other Database number is selected when persisting an object then this number is choosen. |
|  DefaultPlacementPage | If no other Page number is selected when persisting an object then this number is choosen. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

[Placement Class](#)

[VelocityDb Namespace](#)

Placement Constructor (SessionBase, IOptimizedPersistable, IOptimizedPersistable, Boolean, UInt32, Boolean)

Creates a Placement used for choosing a place to persist objects

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Placement (
    SessionBase session,
    IOptimizedPersistable placementProviderObject,
    IOptimizedPersistable objectToPlace,
    bool persistRefs = false,
    uint maxNumberOfDatabases = 4294967295,
    bool flushFullPages = true
)
```

VB

```
Public Sub New (
    session As SessionBase,
    placementProviderObject As IOptimizedPersistable,
    objectToPlace As IOptimizedPersistable,
    Optional persistRefs As Boolean = false,
    Optional maxNumberOfDatabases As UIntInteger = 4294967295,
    Optional flushFullPages As Boolean = true
)
```

C++

```
public:
Placement (
    SessionBase^ session,
    IOptimizedPersistable^ placementProviderObject,
    IOptimizedPersistable^ objectToPlace,
    bool persistRefs = false,
    unsigned int maxNumberOfDatabases = 4294967295,
    bool flushFullPages = true
)
```

F#

```
new :
    session : SessionBase *
    placementProviderObject : IOptimizedPersistable *
    objectToPlace : IOptimizedPersistable *
    ?persistRefs : bool *
    ?maxNumberOfDatabases : uint32 *
    ?flushFullPages : bool
(* Defaults:
    let _persistRefs = defaultArg persistRefs false
```

```
        let_maxNumberOfDatabases = defaultArg maxNumberOfDatabases 4294967295
        let_flushFullPages = defaultArg flushFullPages true
    *)
-> Placement
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session being used

placementProviderObject

Type: [VelocityDb.IOptimizedPersistable](#)

If persistent, placement uses this object's db, page and slot as a starting point for placements

objectToPlace

Type: [VelocityDb.IOptimizedPersistable](#)

An object of the type we are going to persist with this placement object

persistRefs (Optional)

Type: [System.Boolean](#)

Is the placement going to request that referenced objects also get persisted?

maxNumberOfDatabases (Optional)

Type: [System.UInt32](#)

Maximum number of databases to try for placement

flushFullPages (Optional)

Type: [System.Boolean](#)

Shall a detected full page be flushed if such page is found while persisting an object with this placement

See Also

    let_flushFullPages = defaultArg flushFullPages true
*)
-> Placement

```

*Parameters**db*Type: [System.UInt32](#)

Database number requested for placement

page (Optional)Type: [System.UInt16](#)

Page number requested for placement

slot (Optional)Type: [System.UInt16](#)

Slot number requested for placement

objectsPerPage (Optional)Type: [System.UInt16](#)

Limit the number of objects per page

pagesPerDatabase (Optional)Type: [System.UInt16](#)

Limit the number of pages per database

persistRefs (Optional)Type: [System.Boolean](#)

VelocityDB Class Library

When persisting an object, shall references be persisted at the same time or later when flushing pages to disk

tryOtherDatabaseIfLockConflict (Optional)

Type: [System.Boolean](#)

Is another Database acceptable

maxNumberOfDatabases (Optional)

Type: [System.UInt32](#)

Maximum number of databases to try for placement

allowOtherTypesOnSamePage (Optional)

Type: [System.Boolean](#)

Is it OK to place object on a page which contains other types

flushFullPages (Optional)

Type: [System.Boolean](#)

Is it OK to flush encountered full pages?

Gets the current Database number to try with first for object placement.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint TryDatabaseNumber { get; set; }
```

VB

```
Public Property TryDatabaseNumber As UInteger  
    Get  
    Set
```

C++

```
public:  
property unsigned int TryDatabaseNumber {  
    unsigned int get ();  
    void set (unsigned int value);  
}
```

F#

```
member TryDatabaseNumber : uint32 with get, set
```

Property Value

Type: [UInt32](#)

See Also

[Placement Class](#)

[VelocityDb Namespace](#)

Placement.TryPageNumber Property

Gets/sets the page number to try with first when persisting a new object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort TryPageNumber { get; set; }
```

VB

```
Public Property TryPageNumber As UShort  
    Get  
    Set
```

C++

```
public:  
property unsigned short TryPageNumber {  
    unsigned short get ();  
    void set (unsigned short value);  
}
```

F#

```
member TryPageNumber : uint16 with get, set
```

Property Value

Type: [UInt16](#)

See Also

[Placement Class](#)

[VelocityDb Namespace](#)

Placement.TrySlotNumber Property

Gets/sets the page number to try next when persisting an object.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort TrySlotNumber { get; set; }
```

VB

```
Public Property TrySlotNumber As UShort  
    Get  
    Set
```

C++

```
public:  
property unsigned short TrySlotNumber {  
    unsigned short get ();  
    void set (unsigned short value);  
}
```

F#

```
member TrySlotNumber : uint16 with get, set
```

Property Value

Type: [UInt16](#)

See Also

Placement.Placement Methods

The [Placement](#) type exposes the following members.

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  IncrementTryDatabaseNumber | Increments the Database number used when placing (persisting) objects |
|  IncrementTryPageNumber | Increments the tryPageNumber by 1 |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase) .) |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean) .) |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

See Also

[Placement Class](#)

[VelocityDb Namespace](#)

Placement.IncrementTryDatabaseNumber Method

Incremnts the Database number used when placing (persisting) objects

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual uint IncrementTryDatabaseNumber ()
```

VB

```
Public Overridable Function IncrementTryDatabaseNumber As UInteger
```

C++

```
public:  
virtual unsigned int IncrementTryDatabaseNumber ()
```

F#

```
abstract IncrementTryDatabaseNumber : unit -> uint32  
override IncrementTryDatabaseNumber : unit -> uint32
```

Return Value

Type: [UInt32](#)

The Database number before incrementing

See Also

[Placement Class](#)

[VelocityDb Namespace](#)

Placement.IncrementTryPageNumber Method

Increments the tryPageNumber by 1

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort IncrementTryPageNumber ()
```

VB

```
Public Function IncrementTryPageNumber As UShort
```

C++

```
public:  
unsigned short IncrementTryPageNumber ()
```

F#

```
member IncrementTryPageNumber : unit -> uint16
```

Return Value

Type: [UInt16](#)

The tryPageNumber before the increment

See Also

[Placement Class](#)

[VelocityDb Namespace](#)

Placement.InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRecreate(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRecreate(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit  
override InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRecreate\(SessionBase\)](#)

See Also

```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

[Missing <param name="typeVersion"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

memberBytes

Type: [System.Byte\[\]](#)

[Missing <param name="memberBytes"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,V

elocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

offset

Type: [System.Int32](#)

[Missing <param name="offset"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

page

Type: [VelocityDb.Page](#)

[Missing <param name="page"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

useOidShort

Type: [System.Boolean](#)

[Missing <param name="useOidShort"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

schema

Type: [VelocityDb.TypeInfo.Schema](#)

[Missing <param name="schema"/> documentation for

"M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

openRefs

Type: [System.Boolean](#)

[Missing <param name="openRefs"/> documentation for "M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

[Missing <param name="toLoadMembers"/> documentation for "M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

graphDepth

Type: [System.Int32](#)

[Missing <param name="graphDepth"/> documentation for "M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

graphDepthToLoad

Type: [System.Int32](#)

[Missing <param name="graphDepthToLoad"/> documentation for "M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

primitivesOnly

Type: [System.Boolean](#)

[Missing <param name="primitivesOnly"/> documentation for "M:VelocityDb.Placement.ReadMe(VelocityDb.TypeInfo.TypeVersion,System.Byte[],System.Int32@,VelocityDb.Session.SessionBase,VelocityDb.Page,System.Boolean,VelocityDb.TypeInfo.Schema,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean)"]

Implements

[IOptimizedPersistable.ReadMe\(TypeVersion,Byte\[\], Int32, SessionBase, Page, Boolean, Schema, Boolean, List<IOptimizedPersistable>, Int32, Int32, Boolean\)](#)

Placement.DefaultPlacementDatabaseNumber Field

If no other Database number is selected when persisting an object then this number is chosen.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public const uint DefaultPlacementDatabaseNumber = 10
```

VB

```
Public Const DefaultPlacementDatabaseNumber As UInteger = 10
```

C++

```
public:  
literal unsigned int DefaultPlacementDatabaseNumber = 10
```

F#

```
static val mutable DefaultPlacementDatabaseNumber: uint32
```

Field Value

Type: [UInt32](#)

[VelocityDb Namespace](#)

Placement.DefaultPlacementPage Field

If no other Page number is selected when persisting an object then this number is chosen.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public const ushort DefaultPlacementPage = 1
```

VB

```
Public Const DefaultPlacementPage As UShort = 1
```

C++

```
public:  
literal unsigned short DefaultPlacementPage = 1
```

F#

```
static val mutable DefaultPlacementPage: uint16
```

Field Value

Type: [UInt16](#)

ReferenceTracked Class

Tracks references to this object and signals [ReferentialIntegrityException](#) if unpersisted before while still being referenced.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.ReferenceTracked

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class ReferenceTracked : OptimizedPersistable,
    IReferenceTracked, IOptimizedPersistable, IComparable
```

VB

```
Public Class ReferenceTracked
    Inherits OptimizedPersistable
    Implements IReferenceTracked, IOptimizedPersistable, IComparable
```

C++

```
public ref class ReferenceTracked : public OptimizedPersistable,
    IReferenceTracked, IOptimizedPersistable, IComparable
```

F#

```
type ReferenceTracked =
    class
        inherit OptimizedPersistable
        interface IReferenceTracked
        interface IOptimizedPersistable
        interface IComparable
    end
```

The **ReferenceTracked** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------------|-----------------------------------------------------------------|
|  | ReferenceTracked | Initializes a new instance of the ReferenceTracked class |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|-----------------------------------------------|
|  | References | Get a collection of references to this object |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase).) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

ReferenceTracked.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

[ReferenceTracked Class](#)

[VelocityDb Namespace](#)

WeakIOptimizedPersistableReference(T) Class

When a persistent object is opened, all its referenced objects are opened as well. In order to limit the number of opened objects, you need to use this class. A reference from an instance of this class will not cause the referenced object to be opened. It will be opened when you ask for it.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.WeakIOptimizedPersistableReferenceBase](#)

VelocityDb.WeakIOptimizedPersistableReference(T)

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class WeakIOptimizedPersistableReference<T> :
WeakIOptimizedPersistableReferenceBase
where T : IOptimizedPersistable
```

VB

```
<SerializableAttribute>
Public Class WeakIOptimizedPersistableReference (Of T As
IOptimizedPersistable)
    Inherits WeakIOptimizedPersistableReferenceBase
```

C++

```
[SerializableAttribute]
generic<typename T>
where T : IOptimizedPersistable
public ref class WeakIOptimizedPersistableReference : public
WeakIOptimizedPersistableReferenceBase
```

F#

```
[<SerializableAttribute>]
type WeakIOptimizedPersistableReference<'T when 'T : IOptimizedPersistable> =
    class
        inherit WeakIOptimizedPersistableReferenceBase
    end
```

Type Parameters

T

The [Type](#) of the weak referenced object, must be [OptimizedPersistable](#)

The WeakIOptimizedPersistableReference(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
|  | WeakIOptimizedPersistableReference(T)(UInt64) | Creates a weak reference to some OptimizedPersistable object |
|  | WeakIOptimizedPersistableReference(T)(T) | Creates a weak reference to some OptimizedPersistable object. This object must be persisted before adding as a weak reference. |
|  | WeakIOptimizedPersistableReference(T)(Oid) | Creates a weak reference to some OptimizedPersistable object |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------|-------------------------------------------------------------------------------------------------------------------|
|  | Id | Id of weak referenced object (Overrides WeakIOptimizedPersistableReferenceBase.Id.) |
|  | ShortId | Short reference ID of weak reference (Overrides WeakIOptimizedPersistableReferenceBase.ShortId.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------|--------------------------------------------------------------------------------------------------------|
|  | GetTarget | Gets the persistent object referenced by the weak reference |
|  | ToString | Append the Oid of the referenced object to the string. (Overrides Object.ToString().) |

[VelocityDb Namespace](#)

WeakIOptimizedPersistableReference(T) Constructor (UInt64)

Creates a weak reference to some OptimizedPersistable object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public WeakIOptimizedPersistableReference (  
    ulong oid  
)
```

VB

```
Public Sub New (  
    oid As ULong  
)
```

C++

```
public:  
WeakIOptimizedPersistableReference (  
    unsigned long long oid  
)
```

F#

```
new :  
    oid : uint64 -> WeakIOptimizedPersistableReference
```

Parameters

oid

Type: [System.UInt64](#)

Can be created using `Oid.Encode(databaseNumber, pageNumber, pageNumber)`

See Also

[WeakIOptimizedPersistableReference\(T\)Class](#)

[WeakIOptimizedPersistableReference\(T\)Overload](#)

[VelocityDb Namespace](#)

WeakIOptimizedPersistableReference(T) Constructor (T)

Creates a weak reference to some OptimizedPersistable object. This object must be persisted before adding as a weak reference.

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public WeakIOptimizedPersistableReference (  
    T obj  
)
```

VB

```
Public Sub New (  
    obj As T  
)
```

C++

```
public:  
WeakIOptimizedPersistableReference (  
    T obj  
)
```

F#

```
new :  
    obj : 'T -> WeakIOptimizedPersistableReference
```

Parameters

obj

Type: *T*

[Missing <param name="obj"/> documentation for "M:VelocityDb.WeakIOptimizedPersistableReference`1.#ctor(`0)"]

Creates a weak reference to some OptimizedPersistable object

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public WeakIOptimizedPersistableReference (  
    Oid oid  
)
```

VB

```
Public Sub New (  
    oid As Oid  
)
```

C++

```
public:  
WeakIOptimizedPersistableReference (  
    Oid oid  
)
```

F#

```
new :  
    oid : Oid -> WeakIOptimizedPersistableReference
```

Parameters

oid

Type: [VelocityDb.Oid](#)

Can be created using `Oid.Encode(databaseNumber, pageNumber, pageNumber)`

Gets the persistent object referenced by the weak reference

Namespace: [VelocityDb](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public T GetTarget(  
    bool update,  
    SessionBase session  
)
```

VB

```
Public Function GetTarget (  
    update As Boolean,  
    session As SessionBase  
) As T
```

C++

```
public:  
T GetTarget(  
    bool update,  
    SessionBase^ session  
)
```

F#

```
member GetTarget :  
    update : bool *  
    session : SessionBase -> 'T
```

Parameters

update

Type: [System.Boolean](#)

Open the persistent object for update?

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing the persistent object

Return Value

Type: *T*

The object referenced by this weak reference

[VelocityDb Namespace](#)

WeakIOptimizedPersistableReferenceX(T) Class

Note: This API is now obsolete.

Deprecated, use WeakIOptimizedPersistableReference instead (so name conflict can be avoided) When a persistent object is opened, all its referenced objects are opened as well. In order to limit the number of opened objects, you need to use this class. A reference from an instance of this class will not cause the referenced object to be opened. It will be opened when you ask for it. The [Type](#) of the weak referenced object, must be [OptimizedPersistable](#)

Inheritance Hierarchy

```

*Type Parameters**T*

[Missing <typeparam name="T"/> documentation for "T:VelocityDb.WeakIOptimizedPersistableReferenceX`1"]

The WeakIOptimizedPersistableReferenceX(T) type exposes the following members.

Constructors

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|  WeakIOptimizedPersistableReferenceX(T)(UInt64) | Creates a weak reference to some OptimizedPersistable object Can be created using <code>Oid.Encode(databaseNumber, pageNumber, pageNumber)</code> |
|  WeakIOptimizedPersistableReferenceX(T)(T) | Creates a weak reference to some OptimizedPersistable object. This object must be persisted before adding as a weak reference. |
|  WeakIOptimizedPersistableReferenceX(T)(Oid) | Creates a weak reference to some OptimizedPersistable object Can be created using <code>Oid.Encode(databaseNumber, pageNumber, pageNumber)</code> |

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
|  Id | Id of weak referenced object (Overrides WeakIOptimizedPersistableReferenceBase.Id.) |
|  ShortId | Short reference ID of weak reference (Overrides WeakIOptimizedPersistableReferenceBase.ShortId.) |

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
|  GetTarget | Gets the persistent object referenced by the weak reference |
|  ToString | Append the Oid of the referenced object to the string. (Overrides Object.ToString().) |

```
public:  
T GetTarget(  
    bool update,  
    SessionBase^ session  
)
```

F#

```
member GetTarget :  
    update : bool *  
    session : SessionBase -> 'T
```

Parameters

update

Type: [System.Boolean](#)

Open the persistent object for update?

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing the persistent object

Return Value

Type: *T*

The object referenced by this weak reference

[WeakIOptimizedPersistableReferenceX\(T\) Class](#)

[VelocityDb Namespace](#)

VelocityDb.Collection Namespace

The `VelocityDb.Collection` namespace contains classes for the VelocityDb collections optimized for persistent storage in VelocityDb databases

Classes

| Class | Description |
|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
|  SortedMap(Key, Value) | A sorted map |
|  SortedMapBase(Key, Value) | A base class for sorted maps. |
|  SortedMapOidShort(Key, Value) | A sorted map where all keys and values and the map are contained within a single Database |
|  SortedMapValueOidShort(Key, Value) | A sorted map where all values are located within a single Database |
|  SortedSetAny(Key) | A sorted set of objects of any Type (not just subclasses of OptimizedPersistable) |
|  SortedSetBase(Key) | A base class for sorted sets |
|  SortedSetOidShort(Key) | A sorted set where the set and all its elements are contained in a single Database |
|  VelocityDbHashSet(T) | A hash code based set |
|  VelocityDbList(T) | A list with an Oid containing objects ordered by index. |
|  VelocityDbListOidShort(T) | List of objects where list and all elements of a list are contained within a single Database |
|  WeakReferenceList(T) | List with an Id containing object Ids ordered by index. |
|  WeakReferenceListBase(T) | List with an Id containing object Ids ordered by index. |
|  WeakShortReferenceList(T) | List with an Id containing object short Ids (page and slot) ordered by index. |

Structures

| Structure | Description |
|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
|  VelocityDbHashSet(T).Enumerator | Enumerates the elements of a VelocityDbHashSet(Of T) . |

SortedMap(Key, Value) Class

A sorted map

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

[VelocityDb.Collection.SortedSetBase\(Key\)](#)

[VelocityDb.Collection.SortedMapBase\(Key, Value\)](#)

VelocityDb.Collection.SortedMap(Key, Value)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class SortedMap<Key, Value> : SortedMapBase<Key, Value>
```

VB

```
<SerializableAttribute>  
Public Class SortedMap(Of Key, Value)  
    Inherits SortedMapBase(Of Key, Value)
```

C++

```
[SerializableAttribute]  
generic<typename Key, typename Value>  
public ref class SortedMap : public SortedMapBase<Key, Value>
```

F#

```
[<SerializableAttribute>]  
type SortedMap<'Key, 'Value> =  
    class  
        inherit SortedMapBase<'Key, 'Value>  
    end
```

Type Parameters

Key

Element key type

Value

Element value type

The SortedMap(Key, Value) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------|----------------------------------------------|
|  | SortedMap(Key, Value)(Int32) | Constructs a new map |
|  | SortedMap(Key, Value)(VelocityDbComparer(Key)) | Constructs a new map with a given comparator |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the Key comparator of the map (Overrides SortedSetBase(Key).Comparer.) |
|  | Keys | Gets the internal list of NodeKeys (Overrides SortedSetBase(Key).Keys.) |
|  | Values | Gets the internal list of NodeValues (Overrides SortedMapBase(Key, Value).Values.) |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Persist | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. (Overrides OptimizedPersistable.Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

SortedMap(Key, Value) Constructor

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------|----------------------------------------------|
|  | SortedMap(Key, Value)(Int32) | Constructs a new map |
|  | SortedMap(Key, Value)(VelocityDbComparer(Key)) | Constructs a new map with a given comparator |

See Also

[SortedMap\(Key, Value\)Class](#)

[VelocityDb.Collection Namespace](#)

SortedMap(Key, Value) Constructor (Int32)

Constructs a new map

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SortedMap(  
    int capacity = 0  
)
```

VB

```
Public Sub New (  
    Optional capacity As Integer = 0  
)
```

C++

```
public:  
SortedMap(  
    int capacity = 0  
)
```

F#

```
new :  
    ?capacity : int  
(* Defaults:  
    let_capacity = defaultArg capacity 0  
)  
-> SortedMap
```

Parameters

capacity (Optional)

Type: [System.Int32](#)

Resizes internal list to a requested size

See Also

[SortedMap\(Key, Value\)Class](#)

[SortedMap\(Key, Value\)Overload](#)

[VelocityDb.Collection Namespace](#)

SortedMap(Key, Value) Constructor (VelocityDbComparer(Key))

Constructs a new map with a given comparator

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SortedMap(  
    VelocityDbComparer<Key> comparer  
)
```

VB

```
Public Sub New (  
    comparer As VelocityDbComparer(Of Key)  
)
```

C++

```
public:  
SortedMap(  
    VelocityDbComparer<Key>^ comparer  
)
```

F#

```
new :  
    comparer : VelocityDbComparer<'Key> -> SortedMap
```

Parameters

comparer

Type: [VelocityDb.Collection.Comparer.VelocityDbComparer\(Key\)](#)

The comparator is referenced by a OidShort so it must exist within the same Database as the SortedMap

SortedMap(Key, Value).SortedMap(Key, Value) Properties

The [SortedMap\(Key, Value\)](#) generic type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the Key comparator of the map (Overrides SortedSetBase(Key).Comparer.) |
|  | Keys | Gets the internal list of NodeKeys (Overrides SortedSetBase(Key).Keys.) |
|  | Values | Gets the internal list of NodeValues (Overrides SortedMapBase(Key, Value).Values.) |

SortedMap(Key, Value).Comparer Property

Gets the Key comparator of the map

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override VelocityDbComparer<Key> Comparer { get; }
```

VB

```
Public Overrides ReadOnly Property Comparer As VelocityDbComparer(Of Key)  
    Get
```

C++

```
public:  
virtual property VelocityDbComparer<Key>^ Comparer {  
    VelocityDbComparer<Key>^ get () override;  
}
```

F#

```
abstract Comparer : VelocityDbComparer<'Key> with get  
override Comparer : VelocityDbComparer<'Key> with get
```

Property Value

Type: [VelocityDbComparer\(Key\)](#)

SortedMap(Key, Value).Persist Method

Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ulong Persist(
    Placement place,
    SessionBase session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable> toPersist = null
)
```

VB

```
Public Overrides Function Persist (
    place As Placement,
    session As SessionBase,
    Optional persistRefs As Boolean = true,
    Optional disableFlush As Boolean = false,
    Optional toPersist As Queue(Of IOptimizedPersistable) = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    Placement^ place,
    SessionBase^ session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable^>^ toPersist = nullptr
) override
```

F#

```
abstract Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
override Persist :
```

```
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

The placement rules to follow when persisting this object

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

persistRefs (Optional)

Type: [System.Boolean](#)

If true, objects referenced from this object will also be persisted

disableFlush (Optional)

Type: [System.Boolean](#)

If true, disables possible flushing of updated pages while persisting this object; otherwise page flushing may occur

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A queue of objects remaining to be persisted. Pass as a parameter to session.Persist

Return Value

Type: [UInt64](#)

The object id of this persistent object

Implements

[IOptimizedPersistable.Persist\(Placement, SessionBase, Boolean, Boolean, Queue<IOptimizedPersistable>\)](#)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public abstract class SortedMapBase<Key, Value> : SortedSetBase<Key>,  
    IEnumerable<KeyValuePair<Key, Value>>, IEnumerable
```

VB

```
<SerializableAttribute>  
Public MustInherit Class SortedMapBase(Of Key, Value)  
    Inherits SortedSetBase(Of Key)  
    Implements IEnumerable(Of KeyValuePair(Of Key, Value)),  
    IEnumerable
```

C++

```
[SerializableAttribute]  
generic<typename Key, typename Value>  
public ref class SortedMapBase abstract : public SortedSetBase<Key>,  
    IEnumerable<KeyValuePair<Key, Value>>, IEnumerable
```

F#

```
[<AbstractClassAttribute>]  
[<SerializableAttribute>]  
type SortedMapBase<'Key, 'Value> =  
    class  
        inherit SortedSetBase<'Key>  
        interface IEnumerable<KeyValuePair<'Key, 'Value>>  
        interface IEnumerable  
    end
```

*Type Parameters***Key**

A key type for a map

Value

A value type for a map

The SortedMapBase(Key, Value) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------|----------------------------------------------|
|  | Item | Gets or sets the value associated with a key |
|  | Values | The map values as a list |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
|  | Add(KeyValuePair(Key, Value)) | Add to a map |
|  | Add(Key, Value) | Add to a map |
|  | Clear | Removes all keys and values from the map, leaving the map empty (Overrides SortedSetBase(Key).Clear() .) |
|  | Contains | Check if map contains a key value pair |
|  | ContainsKey | Checks if map contains a key |
|  | CopyTo | throw new NotImplementedException(); |
|  | GetEnumerator | |
|  | IsEmpty | Check if map is empty |
|  | Remove(KeyValuePair(Key, Value)) | Removes a key value pair from the map (if found) |
|  | Remove(Key) | Removes a key from the map (if found) (Overrides SortedSetBase(Key).Remove(Key) .) |
|  | TryGetValue | Gets the value associated with the specified key. |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

SortedMapBase(Key, Value).Item Property

Gets or sets the value associated with a key

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Value this[
    Key key
] { get; set; }
```

VB

```
Public Default Property Item (
    key As Key
) As Value
    Get
    Set
```

C++

```
public:
property Value default[Key key] {
    Value get (Key key);
    void set (Key key, Value value);
}
```

F#

```
member Item : 'Value with get, set
```

Parameters

key

Type: *Key*

The lookup key

Return Value

Type: *Value*

The value associated with a key or throws *KeyNotFoundException*

SortedMapBase(Key, Value).Add Method (KeyValuePair(Key, Value))

Add to a map

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Add(  
    KeyValuePair<Key, Value> keyValue  
)
```

VB

```
Public Sub Add (  
    keyValue As KeyValuePair(Of Key, Value)  
)
```

C++

```
public:  
void Add(  
    KeyValuePair<Key, Value> keyValue  
)
```

F#

```
member Add :  
    keyValue : KeyValuePair<'Key, 'Value> -> unit
```

Parameters

keyValue

Type: [System.Collections.Generic.KeyValuePair](#)(Key, Value)

key and value being added

See Also

[VelocityDb.Collection Namespace](#)

SortedMapBase(Key, Value).Add Method (Key, Value)

Add to a map

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Add(  
    Key key,  
    Value value  
)
```

VB

```
Public Sub Add (  
    key As Key,  
    value As Value  
)
```

C++

```
public:  
void Add(  
    Key key,  
    Value value  
)
```

F#

```
member Add :  
    key : 'Key *  
    value : 'Value -> unit
```

Parameters

key

Type: *Key*

key added

value

Type: *Value*

value added

SortedMapBase(Key, Value).Contains Method

Check if map contains a key value pair

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Contains(  
    KeyValuePair<Key, Value> keyValue  
)
```

VB

```
Public Function Contains (  
    keyValue As KeyValuePair(Of Key, Value)  
) As Boolean
```

C++

```
public:  
bool Contains(  
    KeyValuePair<Key, Value> keyValue  
)
```

F#

```
member Contains :  
    keyValue : KeyValuePair<'Key, 'Value> -> bool
```

Parameters

keyValue

Type: [System.Collections.Generic.KeyValuePair](#)(Key, Value)

[Missing <param name="keyValue"/> documentation for

"M:VelocityDb.Collection.SortedMapBase`2.Contains(System.Collections.Generic.KeyValuePair{`0,`1})"

Return Value

Type: [Boolean](#)

true if map contains the key value pair

Removes a key value pair from the map (if found)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Remove(  
    KeyValuePair<Key, Value> keyValue  
)
```

VB

```
Public Function Remove (  
    keyValue As KeyValuePair(Of Key, Value)  
) As Boolean
```

C++

```
public:  
bool Remove(  
    KeyValuePair<Key, Value> keyValue  
)
```

F#

```
member Remove :  
    keyValue : KeyValuePair<'Key, 'Value> -> bool
```

Parameters

keyValue

Type: [System.Collections.Generic.KeyValuePair\(Key, Value\)](#)

[Missing <param name="keyValue"/> documentation for "M:VelocityDb.Collection.SortedMapBase`2.Remove(System.Collections.Generic.KeyValuePair{`0,`1})"]

Return Value

Type: [Boolean](#)

true if key was found and removed; otherwise false

See Also

[SortedMapBase\(Key, Value\)Class](#)

SortedMapBase(Key, Value).Remove Method (Key)

Removes a key from the map (if found)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool Remove (  
    Key key  
)
```

VB

```
Public Overrides Function Remove (  
    key As Key  
) As Boolean
```

C++

```
public:  
virtual bool Remove (  
    Key key  
) override
```

F#

```
abstract Remove :  
    key : 'Key -> bool  
override Remove :  
    key : 'Key -> bool
```

Parameters

key

Type: Key

[Missing <param name="key"/> documentation for "M:VelocityDb.Collection.SortedMapBase`2.Remove(`0)"]

Return Value

Type: [Boolean](#)

true if key was found and removed; otherwise false

See Also

[SortedMapBase\(Key, Value\)Class](#)

[Remove Overload](#)

[VelocityDb.Collection Namespace](#)

SortedMapBase(Key, Value).TryGetValue Method

Gets the value associated with the specified key.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TryGetValue(  
    Key key,  
    out Value value  
)
```

VB

```
Public Function TryGetValue (  
    key As Key,  
    <OutAttribute> ByRef value As Value  
) As Boolean
```

C++

```
public:  
bool TryGetValue(  
    Key key,  
    [OutAttribute] Value% value  
)
```

F#

```
member TryGetValue :  
    key : 'Key *  
    value : 'Value byref -> bool
```

Parameters

key

Type: *Key*

The key of the value to get.

value

Type: *Value*

When this method returns, contains the value associated with the specified key, if the key is found; otherwise, the default value for the type of the value parameter. This parameter is passed uninitialized.

Return Value

Type: [Boolean](#)

true if the set contains an element with the specified key; otherwise, false.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class SortedMapOidShort<Key, Value> : SortedMapBase<Key, Value>  
where Key : OptimizedPersistable  
where Value : OptimizedPersistable
```

VB

```
<SerializableAttribute>  
Public Class SortedMapOidShort(Of Key As OptimizedPersistable, Value As  
OptimizedPersistable)  
    Inherits SortedMapBase(Of Key, Value)
```

C++

```
[SerializableAttribute]  
generic<typename Key, typename Value>  
where Key : OptimizedPersistable  
where Value : OptimizedPersistable  
public ref class SortedMapOidShort : public SortedMapBase<Key, Value>
```

F#

```
[<SerializableAttribute>]  
type SortedMapOidShort<'Key, 'Value when 'Key : OptimizedPersistable when  
'Value : OptimizedPersistable> =  
    class  
        inherit SortedMapBase<'Key, 'Value>  
    end
```

Type Parameters

Key

The Type of keys of this map

Value

The Type of values of this map

The SortedMapOidShort(Key, Value) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------|-----------------------------------------------------------|
|  | SortedMapOidShort(Key, Value)() | Constructs a new empty map |
|  | SortedMapOidShort(Key, Value)(VelocityDbComparer(Key)) | Constructs a new empty map with a given object comparator |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-------------------------------------------------------------------------------------------------|
|  | Comparer | Gets comparator (Overrides SortedSetBase(Key).Comparer.) |
|  | Keys | Gets the internal list of keys (Overrides SortedSetBase(Key).Keys.) |
|  | MaxNumberOfDatabases | (Overrides OptimizedPersistable.MaxNumberOfDatabases.) |
|  | Values | Gets the internal list of values (Overrides SortedMapBase(Key, Value).Values.) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class SortedMapValueOidShort<Key, Value> : SortedMapBase<Key, Value>  
where Value : OptimizedPersistable
```

VB

```
<SerializableAttribute>  
Public Class SortedMapValueOidShort(Of Key, Value As OptimizedPersistable)  
    Inherits SortedMapBase(Of Key, Value)
```

C++

```
[SerializableAttribute]  
generic<typename Key, typename Value>  
where Value : OptimizedPersistable  
public ref class SortedMapValueOidShort : public SortedMapBase<Key, Value>
```

F#

```
[<SerializableAttribute>]  
type SortedMapValueOidShort<'Key, 'Value when 'Value : OptimizedPersistable>  
=  
    class  
        inherit SortedMapBase<'Key, 'Value>  
    end
```

Type Parameters

Key

Value

The SortedMapValueOidShort(Key, Value) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------|-------------------------------------------------|
|  | SortedMapValueOidShort(Key, Value)() | Constructs a new map with OidShort based values |
|  | SortedMapValueOidShort(Key, Value)(Int32) | Constructs a new map with OidShort based values |
|  | SortedMapValueOidShort(Key, Value)(VelocityDbComparer(Key)) | Constructs a new map with a given comparator |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the Key comparator of the map (Overrides SortedSetBase(Key).Comparer.) |
|  | Keys | Gets the internal list of NodeKeys (Overrides SortedSetBase(Key).Keys.) |
|  | MaxNumberOfDatabases | (Overrides OptimizedPersistable.MaxNumberOfDatabases.) |
|  | Values | Gets the internal list of NodeValues (Overrides SortedMapBase(Key, Value).Values.) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

generic<typename Key>
public ref class SortedSetAny : public SortedSetBase<Key>,
    ISet<Key>, ICollection<Key>, IEnumerable<Key>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type SortedSetAny<'Key> =
    class
        inherit SortedSetBase<'Key>
        interface ISet<'Key>
        interface ICollection<'Key>
        interface IEnumerable<'Key>
        interface IEnumerable
    end
```

Type Parameters

Key

The type of element for this list.

The SortedSetAny(Key) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------------------------------------|-------------------------------------------------|
|  | SortedSetAny(Key)() | Constructs the set |
|  | SortedSetAny(Key)(Int32) | Constructs a set with a given initial capacity |
|  | SortedSetAny(Key)(VelocityDbComparer(Key)) | Constructs a set with a given object comparator |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------|---------------------------------------------------------------------------------------------|
|  | Comparer | Gets the set comparator (Overrides SortedSetBase(Key).Comparer.) |
|  | Keys | Gets the internal Key list of the set (Overrides SortedSetBase(Key).Keys.) |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------|
|  | Persist | (Overrides OptimizedPersistable.Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

    Queue<IOptimizedPersistable^>^ toPersist = nullptr
) override
```

F#

```
abstract Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let _persistRefs = defaultArg persistRefs true
    let _disableFlush = defaultArg disableFlush false
    let _toPersist = defaultArg toPersist null
```

```
*)
-> uint64
override Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

[Missing <param name="place"/> documentation for "M:VelocityDb.Collection.SortedSetAny`1.Persist(VelocityDb.Placement,VelocityDb.Session.SessionBase,System.Boolean,System.Boolean,System.Collections.Generic.Queue{VelocityDb.IOptimizedPersistable})"]

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for "M:VelocityDb.Collection.SortedSetAny`1.Persist(VelocityDb.Placement,VelocityDb.Session.SessionBase,System.Boolean,System.Boolean,System.Collections.Generic.Queue{VelocityDb.IOptimizedPersistable})"]

persistRefs (Optional)

Type: [System.Boolean](#)

[Missing <param name="persistRefs"/> documentation for "M:VelocityDb.Collection.SortedSetAny`1.Persist(VelocityDb.Placement,VelocityDb.Session.SessionBase,System.Boolean,System.Boolean,System.Collections.Generic.Queue{VelocityDb.IOptimizedPersistable})"]

disableFlush (Optional)

Type: [System.Boolean](#)

[Missing <param name="disableFlush"/> documentation for "M:VelocityDb.Collection.SortedSetAny`1.Persist(VelocityDb.Placement,VelocityDb.Session.SessionBase,System.Boolean,System.Boolean,System.Collections.Generic.Queue{VelocityDb.IOptimizedPersistable})"]

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

[Missing <param name="toPersist"/> documentation for "M:VelocityDb.Collection.SortedSetAny`1.Persist(VelocityDb.Placement,VelocityDb.Session.SessionBa

se,System.Boolean,System.Boolean,System.Collections.Generic.Queue{VelocityDb.IOptimizedPersistable})"]

Return Value

Type: [UInt64](#)

[Missing <returns> documentation for

"M:VelocityDb.Collection.SortedSetAny`1.Persist(VelocityDb.Placement,VelocityDb.Session.SessionBase,System.Boolean,System.Boolean,System.Collections.Generic.Queue{VelocityDb.IOptimizedPersistable})"]

Implements

[IOptimizedPersistable.Persist\(Placement, SessionBase, Boolean, Boolean, Queue\(IOptimizedPersistable\)\)](#)

SortedSetBase(Key) Class

A base class for sorted sets

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

[VelocityDb.Collection.SortedSetBase\(Key\)](#)

[VelocityDb.Collection.SortedMapBase\(Key, Value\)](#)

[VelocityDb.Collection.SortedSetAny\(Key\)](#)

[VelocityDb.Collection.SortedSetOidShort\(Key\)](#)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public abstract class SortedSetBase<Key> : OptimizedPersistable,  
    IEnumerable<Key>, IEnumerable
```

VB

```
<SerializableAttribute>  
Public MustInherit Class SortedSetBase(Of Key)  
    Inherits OptimizedPersistable  
    Implements IEnumerable(Of Key), IEnumerable
```

C++

```
[SerializableAttribute]  
generic<typename Key>  
public ref class SortedSetBase abstract : public OptimizedPersistable,  
    IEnumerable<Key>, IEnumerable
```

F#

```
[<AbstractClassAttribute>]  
[<SerializableAttribute>]  
type SortedSetBase<'Key> =  
    class  
        inherit OptimizedPersistable  
        interface IEnumerable<'Key>  
        interface IEnumerable  
    end
```

Type Parameters

Key

A key type for a set.

The SortedSetBase(Key) type exposes the following members.

Properties

| Name | Description |
|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  Comparer | Gets the IComparer that is used to determine the order of the items in the sorted set |
|  Count | Number of elements in this SortedSetBase |
|  IsEmpty | Returns true if 0 elements are in the set. |
|  IsReadOnly | Returns false |
|  Item | Given a lookup key, returns the corresponding key within the collection or null if not found |
|  Keys | Gets the internal list of NodeKeys |

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
|  Add | Add item to this sorted set. |
|  Clear | Remove all items from this set. |
|  Contains | Checks if this sorted set contains the item |
|  CopyTo | Copy items in this sorted set to array, starting at arrayIndex |
|  IndexOf | Get the index of a given key |
|  Remove | Remove item from this set |
|  RemoveWhere | Remove elements that match specified predicate. Returns the number of elements removed |
|  TryGetValue | Gets the value associated with the specified key. |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

SortedSetBase(Key).Item Property

Given a lookup key, returns the corresponding key within the collection or null if not found

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Key this[
    Key key
] { get; set; }
```

VB

```
Public Default Property Item (
    key As Key
) As Key
    Get
    Set
```

C++

```
public:
property Key default[Key key] {
    Key get (Key key);
    void set (Key key, Key value);
}
```

F#

```
member Item : 'Key with get, set
```

Parameters

key

Type: *Key*

The lookup key

Return Value

Type: *Key*

The key matching the lookup key or null if not found

SortedSetBase(Key).Add Method

Add item to this sorted set.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Add(  
    Key key  
)
```

VB

```
Public Function Add (  
    key As Key  
) As Boolean
```

C++

```
public:  
virtual bool Add(  
    Key key  
) sealed
```

F#

```
abstract Add :  
    key : 'Key -> bool  
override Add :  
    key : 'Key -> bool
```

Parameters

key

Type: *Key*

item to add

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for "M:VelocityDb.Collection.SortedSetBase`1.Add(`0)"]

SortedSetBase(Key).Contains Method

Checks if this sorted set contains the item

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Contains(  
    Key aKey  
)
```

VB

```
Public Function Contains (  
    aKey As Key  
) As Boolean
```

C++

```
public:  
virtual bool Contains(  
    Key aKey  
) sealed
```

F#

```
abstract Contains :  
    aKey : 'Key -> bool  
override Contains :  
    aKey : 'Key -> bool
```

Parameters

aKey

Type: *Key*

item to check for containment

Return Value

Type: [Boolean](#)

true if item contained; false if not

See Also

[SortedSetBase\(Key\)Class](#)

[VelocityDb.Collection Namespace](#)

SortedSetBase(Key).CopyTo Method

Copy items in this sorted set to array, starting at arrayIndex

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    Key[] array,  
    int arrayIndex,  
    int count  
)
```

VB

```
Public Sub CopyTo (  
    array As Key(),  
    arrayIndex As Integer,  
    count As Integer  
)
```

C++

```
public:  
void CopyTo(  
    array<Key>^ array,  
    int arrayIndex,  
    int count  
)
```

F#

```
member CopyTo :  
    array : 'Key[] *  
    arrayIndex : int *  
    count : int -> unit
```

Parameters

array

Type: [Key\[\]](#)

array to add items to

arrayIndex

Type: [System.Int32](#)

index to start at

count

Type: [System.Int32](#)

number of elements to copy

VelocityDB Class Library

SortedSetBase(Key).IndexOf Method

Get the index of a given key

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int IndexOf(  
    Key aKey  
)
```

VB

```
Public Function IndexOf (  
    aKey As Key  
) As Integer
```

C++

```
public:  
int IndexOf(  
    Key aKey  
)
```

F#

```
member IndexOf :  
    aKey : 'Key -> int
```

Parameters

aKey

Type: *Key*

The lookup key

Return Value

Type: [Int32](#)

The index of key or -1 if a matching key was not found.

SortedSetBase(Key).Remove Method

Remove item from this set

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool Remove (  
    Key key  
)
```

VB

```
Public Overridable Function Remove (  
    key As Key  
) As Boolean
```

C++

```
public:  
virtual bool Remove (  
    Key key  
)
```

F#

```
abstract Remove :  
    key : 'Key -> bool  
override Remove :  
    key : 'Key -> bool
```

Parameters

key

Type: *Key*

item to remove

Return Value

Type: [Boolean](#)

true if removed; false if not (i.e. if the item wasn't in the SortedSetBase)

See Also

[SortedSetBase\(Key\)Class](#)

[VelocityDb.Collection Namespace](#)

SortedSetBase(Key).RemoveWhere Method

Remove elements that match specified predicate. Returns the number of elements removed

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int RemoveWhere(  
    Predicate<Key> match  
)
```

VB

```
Public Function RemoveWhere (  
    match As Predicate(Of Key)  
) As Integer
```

C++

```
public:  
int RemoveWhere(  
    Predicate<Key>^ match  
)
```

F#

```
member RemoveWhere :  
    match : Predicate<'Key> -> int
```

Parameters

match

Type: [System.Predicate\(Key\)](#)

[Missing <param name="match"/> documentation for

"M:VelocityDb.Collection.SortedSetBase`1.RemoveWhere(System.Predicate{`0})"]

Return Value

Type: [Int32](#)

[Missing <returns> documentation for

"M:VelocityDb.Collection.SortedSetBase`1.RemoveWhere(System.Predicate{`0})"]

[SortedSetBase\(Key\)Class](#)

[VelocityDb.Collection Namespace](#)

SortedSetBase(Key).TryGetValue Method

Gets the value associated with the specified key.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TryGetValue(  
    Key key,  
    ref Key value  
)
```

VB

```
Public Function TryGetValue (  
    key As Key,  
    ByRef value As Key  
) As Boolean
```

C++

```
public:  
bool TryGetValue(  
    Key key,  
    Key% value  
)
```

F#

```
member TryGetValue :  
    key : 'Key *  
    value : 'Key byref -> bool
```

Parameters

key

Type: *Key*

The key of the value to get.

value

Type: *Key*

When this method returns, contains the value associated with the specified key, if the key is found; otherwise, the default value for the type of the value parameter. This parameter is passed uninitialized.

Return Value

Type: [Boolean](#)

true if the set contains an element with the specified key; otherwise, false.

```

F#

```
[<SerializableAttribute>]  
type SortedSetOidShort<'Key when 'Key : OptimizedPersistable> =  
    class  
        inherit SortedSetBase<'Key>  
    end
```

Type Parameters

Key

The type of elements in the set.

The SortedSetOidShort(Key) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------|
|  | SortedSetOidShort(Key)() | Constructs an OidShort based sorted set. |
|  | SortedSetOidShort(Key)(Int32) | Constructs an OidShort based sorted set with an initial presized capacity |
|  | SortedSetOidShort(Key)(VelocityDbComparer(Key)) | Constructs a new sorted set with a given object comparator. |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|----------------------------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the object comparator (Overrides SortedSetBase(Key).Comparer.) |
|  | Keys | Gets the internal sorted list of objects contained in the set. (Overrides SortedSetBase(Key).Keys.) |
|  | MaxNumberOfDatabases | (Overrides OptimizedPersistable.MaxNumberOfDatabases.) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

SortedSetOidShort(Key).Keys Property

Gets the internal sorted list of objects contained in the set.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override IList<Key> Keys { get; }
```

VB

```
Public Overrides ReadOnly Property Keys As IList(Of Key)  
    Get
```

C++

```
public:  
virtual property IList<Key>^ Keys {  
    IList<Key>^ get () override;  
}
```

F#

```
abstract Keys : IList<'Key> with get  
override Keys : IList<'Key> with get
```

Property Value

Type: [IList\(Key\)](#)

SortedSetOidShort(Key).MaxNumberOfDatabases Property

[Missing <summary> documentation for

"P:VelocityDb.Collection.SortedSetOidShort`1.MaxNumberOfDatabases"]

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override uint MaxNumberOfDatabases { get; }
```

VB

```
Public Overrides ReadOnly Property MaxNumberOfDatabases As UInteger  
    Get
```

C++

```
public:  
virtual property unsigned int MaxNumberOfDatabases {  
    unsigned int get () override;  
}
```

F#

```
abstract MaxNumberOfDatabases : uint32 with get  
override MaxNumberOfDatabases : uint32 with get
```

Property Value

Type: [UInt32](#)

Implements

[IOptimizedPersistable.MaxNumberOfDatabases](#)

VelocityDbHashSet(T) Class

A hash code based set

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Collection.VelocityDbHashSet(T)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class VelocityDbHashSet<T> : OptimizedPersistable,
    ICollection<T>, IEnumerable<T>, IEnumerable
```

VB

```
<SerializableAttribute>
Public Class VelocityDbHashSet(Of T)
    Inherits OptimizedPersistable
    Implements ICollection(Of T), IEnumerable(Of T),
    IEnumerable
```

C++

```
[SerializableAttribute]
generic<typename T>
public ref class VelocityDbHashSet : public OptimizedPersistable,
    ICollection<T>, IEnumerable<T>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type VelocityDbHashSet<'T> =
    class
        inherit OptimizedPersistable
        interface ICollection<'T>
        interface IEnumerable<'T>
        interface IEnumerable
    end
```

Type Parameters

T

The object type of objects in the hashset

The VelocityDbHashSet(T) type exposes the following members.

Constructors

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  VelocityDbHashSet(T)() | Creates a hashset using a default equality comparer |
|  VelocityDbHashSet(T)(IEnumerable(T)) | Creates a new hashset using the default equality comparer |
|  VelocityDbHashSet(T)(IEqualityComparer(T)) | Creates hashset with a given equality comparer |
|  VelocityDbHashSet(T)(IEnumerable(T), IEqualityComparer(T)) | Implementation Notes: Since resizes are relatively expensive (require rehashing), this attempts to minimize the need to resize by setting the initial capacity based on size of collection. |

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  Comparer | Gets the IEqualityComparer that is used to determine equality of keys for the VelocityDbHashSet. |
|  Count | Number of elements in this hashset |
|  ObjectsPerPage | Limit to 1000 per page (instead of default 40000) (Overrides OptimizedPersistable.ObjectsPerPage .) |

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Add | Add item to this VelocityDbHashSet. Returns bool indicating whether item was added (won't be added if already present) |
|  Clear | Remove all items from this set. This clears the elements but not the underlying buckets and slots array. Follow this call by TrimExcess to release these. |
|  Contains | Checks if this hashset contains the item |
|  CopyTo(T[]) | Copies the entire List to a compatible one-dimensional array, starting at the beginning of the target array. |
|  CopyTo(T[], Int32) | Copy items in this hashset to array, starting at arrayIndex |
|  CopyTo(T[], Int32, Int32) | Copies a range of elements from the List(Of T) to a compatible one-dimensional array, starting at the specified index of the target array. |
|  CreateSetComparer | Used for deep equality of VelocityDbHashSet testing |
|  ExceptWith | Remove items in other from this set. Modifies this set. |
|  GetEnumerator | Returns an enumerator that iterates through a collection |
|  GetObjectData | Serialization usage other than VelocityDb serialization |

| | |
|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  IntersectWith | <p>Takes the intersection of this set with other. Modifies this set.</p> <p>Implementation Notes: We get better perf if other is a hashset using same equality comparer, because we get constant contains check in other. Resulting cost is $O(n1)$ to iterate over this. If we can't go above route, iterate over the other and mark intersection by checking contains in this. Then loop over and delete any unmarked elements. Total cost is $n2+n1$. Attempts to return early based on counts alone, using the property that the intersection of anything with the empty set is the empty set.</p> |
|  IsProperSubsetOf | <p>Checks if this is a proper subset of other (i.e. strictly contained in)</p> <p>Implementation Notes: The following properties are used up-front to avoid element-wise checks: 1. If this is the empty set, then it's a proper subset of a set that contains at least one element, but it's not a proper subset of the empty set. 2. If other has unique elements according to this equality comparer, and this has \geq the number of elements in other, then this can't be a proper subset. Furthermore, if other is a hashset using the same equality comparer, we can use a faster element-wise check.</p> |
|  IsProperSupersetOf | <p>Checks if this is a proper superset of other (i.e. other strictly contained in this)</p> <p>Implementation Notes: This is slightly more complicated than above because we have to keep track if there was at least one element not contained in other. The following properties are used up-front to avoid element-wise checks: 1. If this is the empty set, then it can't be a proper superset of any set, even if other is the empty set. 2. If other is an empty set and this contains at least 1 element, then this is a proper superset. 3. If other has unique elements according to this equality comparer, and other's count is greater than or equal to this count, then this can't be a proper superset. Furthermore, if other has unique elements according to this equality comparer, we can use a faster element-wise check.</p> |
|  IsSubsetOf | <p>Checks if this is a subset of other.</p> <p>Implementation Notes: The following properties are used up-front to avoid element-wise checks: 1. If this is the empty set, then it's a subset of anything, including the empty set. 2. If other has unique elements according to this equality comparer, and this has more elements than other, then it can't be a subset. Furthermore, if other is a hashset using the same equality comparer, we can use a faster element-wise check.</p> |
|  IsSupersetOf | <p>Checks if this is a superset of other</p> <p>Implementation Notes: The following properties are used up-front to avoid element-wise checks: 1. If other has no elements (it's the empty set), then this is a superset, even if this is also the empty set. 2. If other has unique elements according to this equality comparer, and this has less than the number of elements in other, then this can't be a superset</p> |
|  Overlaps | <p>Checks if this set overlaps other (i.e. they share at least one item)</p> |
|  Remove | <p>Remove item from this hashset</p> |
|  RemoveWhere | <p>Remove elements that match specified predicate. Returns the number of elements removed</p> |

| | |
|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  SetEquals | Checks if this and other contain the same elements. This is set equality: duplicates and order are ignored |
|  SymmetricExceptWith | Takes symmetric difference (XOR) with other and this set. Modifies this set. |
|  TrimExcess | Sets the capacity of this list to the size of the list (rounded up to nearest prime), unless count is 0, in which case we release references. This method can be used to minimize a list's memory overhead once it is known that no new elements will be added to the list. To completely clear a list and release all memory referenced by the list, execute the following statements: list.Clear(); list.TrimExcess(); |
|  UnionWith | Take the union of this VelocityDbHashSet with other. Modifies this set. Implementation note: GetSuggestedCapacity (to increase capacity in advance avoiding multiple resizes ended up not being useful in practice; quickly gets to the point where it's a wasteful check. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

VelocityDbHashSet(T).CopyTo Method (T[])

Copies the entire List to a compatible one-dimensional array, starting at the beginning of the target array.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo (
    T[] array
)
```

VB

```
Public Sub CopyTo (
    array As T()
)
```

C++

```
public:
void CopyTo (
    array<T>^ array
)
```

F#

```
member CopyTo :
    array : 'T[] -> unit
```

Parameters

array

Type: T[]

The one-dimensional Array that is the destination of the elements copied from List. The Array must have zero-based indexing.

Copy items in this hashset to array, starting at arrayIndex

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    T[] array,  
    int arrayIndex  
)
```

VB

```
Public Sub CopyTo (  
    array As T(),  
    arrayIndex As Integer  
)
```

C++

```
public:  
virtual void CopyTo(  
    array<T>^ array,  
    int arrayIndex  
) sealed
```

F#

```
abstract CopyTo :  
    array : 'T[] *  
    arrayIndex : int -> unit  
override CopyTo :  
    array : 'T[] *  
    arrayIndex : int -> unit
```

Parameters

array

Type: *T*[]

array to add items to

arrayIndex

Type: [System.Int32](#)

index to start at

Implements

[ICollection\(T\).CopyTo\(T\[\], Int32\)](#)

VelocityDB Class Library

See Also

[VelocityDbHashSet\(T\)Class](#)

[CopyTo Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).CopyTo Method (T[], Int32, Int32)

Copies a range of elements from the List(Of T) to a compatible one-dimensional array, starting at the specified index of the target array.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    T[] array,  
    int arrayIndex,  
    int count  
)
```

VB

```
Public Sub CopyTo (  
    array As T(),  
    arrayIndex As Integer,  
    count As Integer  
)
```

C++

```
public:  
void CopyTo(  
    array<T>^ array,  
    int arrayIndex,  
    int count  
)
```

F#

```
member CopyTo :  
    array : 'T[] *  
    arrayIndex : int *  
    count : int -> unit
```

Parameters

array

Type: *T*[]

The one-dimensional Array that is the destination of the elements copied from List(Of T). The Array must have zero-based indexing.

arrayIndex

Type: [System.Int32](#)

The zero-based index in the source List(Of T) at which copying begins.

count

VelocityDB Class Library

Type: [System.Int32](#)

The number of elements to copy.

[VelocityDbHashSet\(T\)Class](#)

[CopyTo Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).CreateSetComparer Method

Used for deep equality of VelocityDbHashSet testing

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IEqualityComparer<VelocityDbHashSet<T>> CreateSetComparer ()
```

VB

```
Public Shared Function CreateSetComparer As IEqualityComparer (Of  
VelocityDbHashSet (Of T))
```

C++

```
public:  
static IEqualityComparer<VelocityDbHashSet<T>^>^ CreateSetComparer ()
```

F#

```
static member CreateSetComparer : unit ->  
IEqualityComparer<VelocityDbHashSet<'T>>
```

Return Value

Type: [IEqualityComparer\(VelocityDbHashSet\(T\)\)](#)

[Missing <returns> documentation for

"M:VelocityDb.Collection.VelocityDbHashSet`1.CreateSetComparer"]

See Also

[VelocityDbHashSet\(T\)Class](#)

VelocityDbHashSet(T).ExceptWith Method

Remove items in other from this set. Modifies this set.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void ExceptWith(  
    IEnumerable<T> other  
)
```

VB

```
Public Sub ExceptWith (  
    other As IEnumerable(Of T)  
)
```

C++

```
public:  
void ExceptWith(  
    IEnumerable<T>^ other  
)
```

F#

```
member ExceptWith :  
    other : IEnumerable<'T> -> unit
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

enumerable with items to remove

See Also

[VelocityDbHashSet\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).GetEnumerator Method

Returns an enumerator that iterates through a collection

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public VelocityDbHashSet<T>.Enumerator GetEnumerator()
```

VB

```
Public Function GetEnumerator As VelocityDbHashSet<T>.Enumerator
```

C++

```
public:  
VelocityDbHashSet<T>.Enumerator GetEnumerator()
```

F#

```
member GetEnumerator : unit -> VelocityDbHashSet<T>.Enumerator
```

Return Value

Type: [VelocityDbHashSet\(T\).Enumerator](#)

An Enumerator object that can be used to iterate through the collection.

[VelocityDbHashSet\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).GetObjectData Method

Serialization usage other than VelocityDb serialization

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void GetObjectData(  
    SerializationInfo info,  
    StreamingContext context  
)
```

VB

```
Public Overridable Sub GetObjectData (  
    info As SerializationInfo,  
    context As StreamingContext  
)
```

C++

```
public:  
virtual void GetObjectData(  
    SerializationInfo^ info,  
    StreamingContext context  
)
```

F#

```
abstract GetObjectData :  
    info : SerializationInfo *  
    context : StreamingContext -> unit  
override GetObjectData :  
    info : SerializationInfo *  
    context : StreamingContext -> unit
```

Parameters

info

Type: [System.Runtime.Serialization.SerializationInfo](#)

[Missing <param name="info"/> documentation for

**"M:VelocityDb.Collection.VelocityDbHashSet`1.GetObjectData(System.Runtime.Serialization.Serializa
tionInfo,System.Runtime.Serialization.StreamingContext)"]**

context

Type: [System.Runtime.Serialization.StreamingContext](#)

[Missing <param name="context"/> documentation for

**"M:VelocityDb.Collection.VelocityDbHashSet`1.GetObjectData(System.Runtime.Serialization.Serializa
tionInfo,System.Runtime.Serialization.StreamingContext)"]**

VelocityDB Class Library

See Also

[VelocityDbHashSet\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).IntersectWith Method

Takes the intersection of this set with other. Modifies this set. Implementation Notes: We get better perf if other is a hashset using same equality comparer, because we get constant contains check in other. Resulting cost is $O(n1)$ to iterate over this. If we can't go above route, iterate over the other and mark intersection by checking contains in this. Then loop over and delete any unmarked elements. Total cost is $n2+n1$. Attempts to return early based on counts alone, using the property that the intersection of anything with the empty set is the empty set.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void IntersectWith(  
    IEnumerable<T> other  
)
```

VB

```
Public Sub IntersectWith (  
    other As IEnumerable(Of T)  
)
```

C++

```
public:  
void IntersectWith(  
    IEnumerable<T>^ other  
)
```

F#

```
member IntersectWith :  
    other : IEnumerable<'T> -> unit
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

enumerable with items to add

See Also

[VelocityDbHashSet\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).IsProperSubsetOf Method

Checks if this is a proper subset of other (i.e. strictly contained in) Implementation Notes: The following properties are used up-front to avoid element-wise checks: 1. If this is the empty set, then it's a proper subset of a set that contains at least one element, but it's not a proper subset of the empty set. 2. If other has unique elements according to this equality comparer, and this has \geq the number of elements in other, then this can't be a proper subset. Furthermore, if other is a hashset using the same equality comparer, we can use a faster element-wise check.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool IsProperSubsetOf(
    IEnumerable<T> other
)
```

VB

```
Public Function IsProperSubsetOf (
    other As IEnumerable(Of T)
) As Boolean
```

C++

```
public:
bool IsProperSubsetOf(
    IEnumerable<T>^ other
)
```

F#

```
member IsProperSubsetOf :
    other : IEnumerable<'T> -> bool
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

[Missing <param name="other"/> documentation for

"M:VelocityDb.Collection.VelocityDbHashSet`1.IsProperSubsetOf(System.Collections.Generic.IEnumerable{`0})"]

Return Value

Type: [Boolean](#)

true if this is a proper subset of other; false if not

See Also

[VelocityDbHashSet\(T\)Class](#)

VelocityDB Class Library

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).IsProperSupersetOf Method

Checks if this is a proper superset of other (i.e. other strictly contained in this) Implementation Notes: This is slightly more complicated than above because we have to keep track if there was at least one element not contained in other. The following properties are used up-front to avoid element-wise checks: 1. If this is the empty set, then it can't be a proper superset of any set, even if other is the empty set. 2. If other is an empty set and this contains at least 1 element, then this is a proper superset. 3. If other has unique elements according to this equality comparer, and other's count is greater than or equal to this count, then this can't be a proper superset Furthermore, if other has unique elements according to this equality comparer, we can use a faster element-wise check.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool IsProperSupersetOf (
    IEnumerable<T> other
)
```

VB

```
Public Function IsProperSupersetOf (
    other As IEnumerable(Of T)
) As Boolean
```

C++

```
public:
bool IsProperSupersetOf (
    IEnumerable<T>^ other
)
```

F#

```
member IsProperSupersetOf :
    other : IEnumerable<'T> -> bool
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

[Missing <param name="other"/> documentation for "M:VelocityDb.Collection.VelocityDbHashSet`1.IsProperSupersetOf(System.Collections.Generic.IEnumerable{`0})"]

Return Value

Type: [Boolean](#)

true if this is a proper superset of other; false if not

VelocityDbHashSet(T).Overlaps Method

Checks if this set overlaps other (i.e. they share at least one item)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Overlaps(  
    IEnumerable<T> other  
)
```

VB

```
Public Function Overlaps (  
    other As IEnumerable(Of T)  
) As Boolean
```

C++

```
public:  
bool Overlaps(  
    IEnumerable<T>^ other  
)
```

F#

```
member Overlaps :  
    other : IEnumerable<'T> -> bool
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

[Missing <param name="other"/> documentation for

"M:VelocityDb.Collection.VelocityDbHashSet`1.Overlaps(System.Collections.Generic.IEnumerable{`0})"
"]

Return Value

Type: [Boolean](#)

true if these have at least one common element; false if disjoint

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).Remove Method

Remove item from this hashset

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Remove(  
    T item  
)
```

VB

```
Public Function Remove (  
    item As T  
) As Boolean
```

C++

```
public:  
virtual bool Remove (  
    T item  
) sealed
```

F#

```
abstract Remove :  
    item : 'T -> bool  
override Remove :  
    item : 'T -> bool
```

Parameters

item

Type: *T*

item to remove

Return Value

Type: [Boolean](#)

true if removed; false if not (i.e. if the item wasn't in the VelocityDbHashSet)

Implements

[ICollection\(T\).Remove\(T\)](#)

See Also

[VelocityDbHashSet\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).RemoveWhere Method

Remove elements that match specified predicate. Returns the number of elements removed

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int RemoveWhere(  
    Predicate<T> match  
)
```

VB

```
Public Function RemoveWhere (  
    match As Predicate(Of T)  
) As Integer
```

C++

```
public:  
int RemoveWhere(  
    Predicate<T>^ match  
)
```

F#

```
member RemoveWhere :  
    match : Predicate<'T> -> int
```

Parameters

match

Type: [System.Predicate\(T\)](#)

[Missing <param name="match"/> documentation for

"M:VelocityDb.Collection.VelocityDbHashSet`1.RemoveWhere(System.Predicate`0)"]

Return Value

Type: [Int32](#)

[Missing <returns> documentation for

"M:VelocityDb.Collection.VelocityDbHashSet`1.RemoveWhere(System.Predicate`0)"]

See Also

[VelocityDbHashSet\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).SymmetricExceptWith Method

Takes symmetric difference (XOR) with other and this set. Modifies this set.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SymmetricExceptWith(  
    IEnumerable<T> other  
)
```

VB

```
Public Sub SymmetricExceptWith (  
    other As IEnumerable(Of T)  
)
```

C++

```
public:  
void SymmetricExceptWith(  
    IEnumerable<T>^ other  
)
```

F#

```
member SymmetricExceptWith :  
    other : IEnumerable<'T> -> unit
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

enumerable with items to XOR

See Also

[VelocityDbHashSet\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).TrimExcess Method

Sets the capacity of this list to the size of the list (rounded up to nearest prime), unless count is 0, in which case we release references. This method can be used to minimize a list's memory overhead once it is known that no new elements will be added to the list. To completely clear a list and release all memory referenced by the list, execute the following statements: list.Clear(); list.TrimExcess();

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void TrimExcess ()
```

VB

```
Public Sub TrimExcess
```

C++

```
public:  
void TrimExcess ()
```

F#

```
member TrimExcess : unit -> unit
```

See Also

[VelocityDbHashSet\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).UnionWith Method

Take the union of this VelocityDbHashSet with other. Modifies this set. Implementation note: GetSuggestedCapacity (to increase capacity in advance avoiding multiple resizes ended up not being useful in practice; quickly gets to the point where it's a wasteful check.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void UnionWith(  
    IEnumerable<T> other  
)
```

VB

```
Public Sub UnionWith (  
    other As IEnumerable(Of T)  
)
```

C++

```
public:  
void UnionWith(  
    IEnumerable<T>^ other  
)
```

F#

```
member UnionWith :  
    other : IEnumerable<'T> -> unit
```

Parameters

other

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

enumerable with items to add

See Also

[VelocityDb.Collection Namespace](#)

VelocityDbHashSet(T).Enumerator Structure

Enumerates the elements of a VelocityDbHashSet(Of T).

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
[HostProtectionAttribute(SecurityAction.LinkDemand, MayLeakOnAbort = true)]
public struct Enumerator : IEnumerator<T>,
    IDisposable, IEnumerator
```

VB

```
<SerializableAttribute>
<HostProtectionAttribute(SecurityAction.LinkDemand, MayLeakOnAbort := true)>
Public Structure Enumerator
    Implements IEnumerator(Of T), IDisposable, IEnumerator
```

C++

```
[SerializableAttribute]
[HostProtectionAttribute(SecurityAction::LinkDemand, MayLeakOnAbort = true)]
public value class Enumerator : IEnumerator<T>,
    IDisposable, IEnumerator
```

F#

```
[<SealedAttribute>]
[<SerializableAttribute>]
[<HostProtectionAttribute(SecurityAction.LinkDemand, MayLeakOnAbort = true)>]
type Enumerator =
    struct
        interface IEnumerator<'T>
        interface IDisposable
        interface IEnumerator
    end
```

The VelocityDbHashSet(T).Enumerator generic type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|---------------------------------|
|  | Current | The iterator current Key object |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------------------|
|  | Dispose | Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. |

| | |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
|  | MoveNext Advances the enumerator to the next element of the collection. |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|

generic<typename T>
public ref class VelocityDbList : public OptimizedPersistable,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type VelocityDbList<'T> =
    class
        inherit OptimizedPersistable
        interface IList<'T>
        interface ICollection<'T>
        interface IEnumerable<'T>
        interface IEnumerable
    end
```

Type Parameters

T

The type of objects contained in this kind of list

The VelocityDbList(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------------------|------------------------------------------------|
|  | VelocityDbList(T)() | Constructs an empty list |
|  | VelocityDbList(T)(Int32) | Constructs a new list with a presized capacity |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  | Count | Number of items in list |
|  | IsFixedSize | Always false |
|  | IsReadOnly | Always false |
|  | IsSynchronized | Always false |
|  | Item | Gets or sets an item at a certain index |
|  | ObjectsPerPage | Limit to 1000 per page (instead of default 40000) (Overrides OptimizedPersistable.ObjectsPerPage.) |
|  | SyncRoot | Used for thread safety |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
|  | Add(T) | Adds an item to a list |
|  | Add(T, Int32) | Adds an item to a list and if array needs to grow to hold new item, it grows to a given max size. |
|  | AddRange | Adds the elements of the given collection to the end of this list. |
|  | BinarySearch | Assuming list elements are sorted by default sort order, finds the position of a an element or position where it would belong |
|  | Clear | Removes all items from the list and frees the array |
|  | Contains | Checks if an item is contained in the list |
|  | CopyTo(Array, Int32) | Copies list to an array |
|  | CopyTo(T[], Int32) | Copies list items to an array |
|  | GetEnumerator | |
|  | IndexOf | Finds the first index of an item |
|  | Insert(Int32, T) | Inserts an item at a specified index |
|  | Insert(Int32, T, Int32) | Inserts an item at a specified index |
|  | InsertRange | Inserts the elements of the given collection at a given index. |
|  | Last | Get the value at the last position in the list |

| | |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  PersistMyReferences | (Overrides OptimizedPersistable.PersistMyReferences(SessionBase, Boolean).) |
|  Remove | Remove an item |
|  RemoveAt | Removes an item at a specified index |
|  RemoveRange | Removes a range of items |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  Get(T) | (Defined by GraphHelpers.) |
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

VelocityDbList(T) Constructor (Int32)

Constructs a new list with a presized capacity

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public VelocityDbList(  
    int capacity  
)
```

VB

```
Public Sub New (  
    capacity As Integer  
)
```

C++

```
public:  
VelocityDbList(  
    int capacity  
)
```

F#

```
new :  
    capacity : int -> VelocityDbList
```

Parameters

capacity

Type: [System.Int32](#)

[Missing <param name="capacity"/> documentation for "M:VelocityDb.Collection.VelocityDbList`1.#ctor(System.Int32)"]

VelocityDbList(T).Count Property

Number of items in list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int Count { get; }
```

VB

```
Public ReadOnly Property Count As Integer  
    Get
```

C++

```
public:  
virtual property int Count {  
    int get () sealed;  
}
```

F#

```
abstract Count : int with get  
override Count : int with get
```

Property Value

Type: [Int32](#)

Implements

[ICollection\(T\).Count](#)

VelocityDbList(T).Item Property

Gets or sets an item at a certain index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual T this[
    int index
] { get; set; }
```

VB

```
Public Overridable Default Property Item (
    index As Integer
) As T
    Get
    Set
```

C++

```
public:
virtual property T default[int index] {
    T get (int index);
    void set (int index, T value);
}
```

F#

```
abstract Item : 'T with get, set
override Item : 'T with get, set
```

Parameters

index

Type: [System.Int32](#)

the item index

Return Value

Type: *T*

the item at the specified index

Implements

[IList\(T\).Item\(Int32\)](#)

See Also

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).ObjectsPerPage Property

Limit to 1000 per page (instead of default 40000)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ushort ObjectsPerPage { get; }
```

VB

```
Public Overrides ReadOnly Property ObjectsPerPage As UShort  
    Get
```

C++

```
public:  
virtual property unsigned short ObjectsPerPage {  
    unsigned short get () override;  
}
```

F#

```
abstract ObjectsPerPage : uint16 with get  
override ObjectsPerPage : uint16 with get
```

Property Value

Type: [UInt16](#)

Implements

[IOptimizedPersistable.ObjectsPerPage](#)

See Also

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).SyncRoot Property

Used for thread safety

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Object SyncRoot { get; }
```

VB

```
Public ReadOnly Property SyncRoot As Object  
    Get
```

C++

```
public:  
property Object^ SyncRoot {  
    Object^ get ();  
}
```

F#

```
member SyncRoot : Object with get
```

Property Value

Type: [Object](#)

VelocityDbList(T).VelocityDbList(T) Methods

The [VelocityDbList\(T\)](#) generic type exposes the following members.

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
|  Add(T) | Adds an item to a list |
|  Add(T, Int32) | Adds an item to a list and if array needs to grow to hold new item, it grows to a given max size. |
|  AddRange | Adds the elements of the given collection to the end of this list. |
|  BinarySearch | Assuming list elements are sorted by default sort order, finds the position of an element or position where it would belong |
|  Clear | Removes all items from the list and frees the array |
|  Contains | Checks if an item is contained in the list |
|  CopyTo(Array, Int32) | Copies list to an array |
|  CopyTo(T[], Int32) | Copies list items to an array |
|  GetEnumerator | |
|  IndexOf | Finds the first index of an item |
|  Insert(Int32, T) | Inserts an item at a specified index |
|  Insert(Int32, T, Int32) | Inserts an item at a specified index |
|  InsertRange | Inserts the elements of the given collection at a given index. |
|  Last | Get the value at the last position in the list |
|  PersistMyReferences | (Overrides OptimizedPersistable.PersistMyReferences(SessionBase, Boolean) .) |
|  Remove | Remove an item |
|  RemoveAt | Removes an item at a specified index |
|  RemoveRange | Removes a range of items |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  Get(T) | (Defined by GraphHelpers .) |
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

VelocityDbList(T).Add Method (T)

Adds an item to a list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Add(  
    T item  
)
```

VB

```
Public Overridable Sub Add (  
    item As T  
)
```

C++

```
public:  
virtual void Add(  
    T item  
)
```

F#

```
abstract Add :  
    item : 'T -> unit  
override Add :  
    item : 'T -> unit
```

Parameters

item

Type: *T*

item being added

Implements

[ICollection\(T\).Add\(T\)](#)

See Also

[VelocityDbList\(T\) Class](#)

[Add Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Add Method (T, Int32)

Adds an item to a list and if array needs to grow to hold new item, it grows to a given max size.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Add(  
    T item,  
    int maxArraySize  
)
```

VB

```
Public Overridable Sub Add (  
    item As T,  
    maxArraySize As Integer  
)
```

C++

```
public:  
virtual void Add(  
    T item,  
    int maxArraySize  
)
```

F#

```
abstract Add :  
    item : 'T *  
    maxArraySize : int -> unit  
override Add :  
    item : 'T *  
    maxArraySize : int -> unit
```

Parameters

item

Type: *T*

item being added

maxArraySize

Type: [System.Int32](#)

the maximum size to use as internal array size

See Also

[VelocityDbList\(T\)Class](#)

[Add Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).AddRange Method

Adds the elements of the given collection to the end of this list.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void AddRange (  
    IEnumerable<T> collection  
)
```

VB

```
Public Sub AddRange (  
    collection As IEnumerable(Of T)  
)
```

C++

```
public:  
void AddRange (  
    IEnumerable<T>^ collection  
)
```

F#

```
member AddRange :  
    collection : IEnumerable<'T> -> unit
```

Parameters

collection

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

to be added

See Also

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).BinarySearch Method

Assuming list elements are sorted by default sort order, finds the position of a an element or position where it would belong

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int BinarySearch(  
    T aKey,  
    out bool isEqual  
)
```

VB

```
Public Function BinarySearch (  
    aKey As T,  
    <OutAttribute> ByRef isEqual As Boolean  
) As Integer
```

C++

```
public:  
int BinarySearch(  
    T aKey,  
    [OutAttribute] bool% isEqual  
)
```

F#

```
member BinarySearch :  
    aKey : 'T *  
    isEqual : bool byref -> int
```

Parameters

aKey

Type: *T*

Element to look for

isEqual

Type: [System.Boolean](#)

true if match found; otherwise false

Return Value

Type: [Int32](#)

Index position

VelocityDB Class Library

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Clear Method

Removes all items from the list and frees the array

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Clear ()
```

VB

```
Public Overridable Sub Clear
```

C++

```
public:  
virtual void Clear ()
```

F#

```
abstract Clear : unit -> unit  
override Clear : unit -> unit
```

Implements

[ICollection\(T\).Clear\(\)](#)

See Also

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Contains Method

Checks if an item is contained in the list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Contains(  
    T item  
)
```

VB

```
Public Function Contains (  
    item As T  
) As Boolean
```

C++

```
public:  
virtual bool Contains(  
    T item  
) sealed
```

F#

```
abstract Contains :  
    item : 'T -> bool  
override Contains :  
    item : 'T -> bool
```

Parameters

item

Type: *T*

the item to look for

Return Value

Type: [Boolean](#)

true if item was found; otherwise false

Implements

[ICollection\(T\).Contains\(T\)](#)

See Also

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).CopyTo Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-------------------------------|
|  | CopyTo(Array, Int32) | Copies list to an array |
|  | CopyTo(T[], Int32) | Copies list items to an array |

See Also

[VelocityDbList\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).CopyTo Method (Array, Int32)

Copies list to an array

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    Array array,  
    int arrayIndex  
)
```

VB

```
Public Sub CopyTo (  
    array As Array,  
    arrayIndex As Integer  
)
```

C++

```
public:  
void CopyTo(  
    Array^ array,  
    int arrayIndex  
)
```

F#

```
member CopyTo :  
    array : Array *  
    arrayIndex : int -> unit
```

Parameters

array

Type: [System.Array](#)

the array to copy to

arrayIndex

Type: [System.Int32](#)

start index in array for copy

See Also

[VelocityDbList\(T\)Class](#)

[CopyTo Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).CopyTo Method (T[], Int32)

Copies list items to an array

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    T[] array,  
    int arrayIndex  
)
```

VB

```
Public Sub CopyTo (  
    array As T(),  
    arrayIndex As Integer  
)
```

C++

```
public:  
virtual void CopyTo(  
    array<T>^ array,  
    int arrayIndex  
) sealed
```

F#

```
abstract CopyTo :  
    array : 'T[] *  
    arrayIndex : int -> unit  
override CopyTo :  
    array : 'T[] *  
    arrayIndex : int -> unit
```

Parameters

array

Type: *T*[]

the array to copy to

arrayIndex

Type: [System.Int32](#)

start array index of copy

Implements

[ICollection\(T\).CopyTo\(T\[\], Int32\)](#)

VelocityDB Class Library

VelocityDbList(T).IndexOf Method

Finds the first index of an item

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int IndexOf(  
    T item  
)
```

VB

```
Public Function IndexOf (  
    item As T  
) As Integer
```

C++

```
public:  
virtual int IndexOf(  
    T item  
) sealed
```

F#

```
abstract IndexOf :  
    item : 'T -> int  
override IndexOf :  
    item : 'T -> int
```

Parameters

item

Type: *T*

item to look for

Return Value

Type: [Int32](#)

-1 if item was not found or first index of item

Implements

[IList\(T\).IndexOf\(T\)](#)

See Also

[VelocityDbList\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Insert Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------------|--------------------------------------|
|  | Insert(Int32, T) | Inserts an item at a specified index |
|  | Insert(Int32, T, Int32) | Inserts an item at a specified index |

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Insert Method (Int32, T)

Inserts an item at a specified index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Insert(  
    int index,  
    T item  
)
```

VB

```
Public Overridable Sub Insert (  
    index As Integer,  
    item As T  
)
```

C++

```
public:  
virtual void Insert(  
    int index,  
    T item  
)
```

F#

```
abstract Insert :  
    index : int *  
    item : 'T -> unit  
override Insert :  
    index : int *  
    item : 'T -> unit
```

Parameters

index

Type: [System.Int32](#)

insert at this index

item

Type: *T*

the item being inserted

Implements

[IList\(T\).Insert\(Int32, T\)](#)

VelocityDB Class Library

See Also

[VelocityDbList\(T\)Class](#)

[Insert Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Insert Method (Int32, T, Int32)

Inserts an item at a specified index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Insert(  
    int index,  
    T item,  
    int maxArraySize  
)
```

VB

```
Public Overridable Sub Insert (  
    index As Integer,  
    item As T,  
    maxArraySize As Integer  
)
```

C++

```
public:  
virtual void Insert(  
    int index,  
    T item,  
    int maxArraySize  
)
```

F#

```
abstract Insert :  
    index : int *  
    item : 'T *  
    maxArraySize : int -> unit  
override Insert :  
    index : int *  
    item : 'T *  
    maxArraySize : int -> unit
```

Parameters

index

Type: [System.Int32](#)

insert at this index

item

Type: *T*

the item being inserted

VelocityDB Class Library

maxArraySize

Type: [System.Int32](#)

Restrict array growth to this maximum size (if array needs to grow)

[Insert Overload](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).InsertRange Method

Inserts the elements of the given collection at a given index.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void InsertRange(  
    int index,  
    IEnumerable<T> collection  
)
```

VB

```
Public Sub InsertRange (  
    index As Integer,  
    collection As IEnumerable(Of T)  
)
```

C++

```
public:  
void InsertRange(  
    int index,  
    IEnumerable<T>^ collection  
)
```

F#

```
member InsertRange :  
    index : int *  
    collection : IEnumerable<'T> -> unit
```

Parameters

index

Type: [System.Int32](#)

start insert at this index

collection

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

to be inserted

See Also

[VelocityDbList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).Last Method

Get the value at the last position in the list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public T Last()
```

VB

```
Public Function Last As T
```

C++

```
public:  
T Last()
```

F#

```
member Last : unit -> 'T
```

Return Value

Type: *T*

The value at the last position in the list

VelocityDbList(T).PersistMyReferences Method

[Missing <summary> documentation for

"M:VelocityDb.Collection.VelocityDbList`1.PersistMyReferences(VelocityDb.Session.SessionBase,System.Boolean)"]

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void PersistMyReferences (
    SessionBase session,
    bool inFlush
)
```

VB

```
Public Overrides Sub PersistMyReferences (
    session As SessionBase,
    inFlush As Boolean
)
```

C++

```
public:
virtual void PersistMyReferences (
    SessionBase^ session,
    bool inFlush
) override
```

F#

```
abstract PersistMyReferences :
    session : SessionBase *
    inFlush : bool -> unit
override PersistMyReferences :
    session : SessionBase *
    inFlush : bool -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for

"M:VelocityDb.Collection.VelocityDbList`1.PersistMyReferences(VelocityDb.Session.SessionBase,System.Boolean)"]

inFlush

Type: [System.Boolean](#)

[Missing <param name="inFlush"/> documentation for "M:VelocityDb.Collection.VelocityDbList`1.PersistMyReferences(VelocityDb.Session.SessionBase,System.Boolean)"]

Implements

[IOptimizedPersistable.PersistMyReferences\(SessionBase, Boolean\)](#)

VelocityDbList(T).Remove Method

Remove an item

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool Remove(  
    T item  
)
```

VB

```
Public Overridable Function Remove (  
    item As T  
) As Boolean
```

C++

```
public:  
virtual bool Remove(  
    T item  
)
```

F#

```
abstract Remove :  
    item : 'T -> bool  
override Remove :  
    item : 'T -> bool
```

Parameters

item

Type: *T*

the item to remove

Return Value

Type: [Boolean](#)

true if item was found and removed; otherwise false

Implements

[ICollection\(T\).Remove\(T\)](#)

See Also

[VelocityDbList\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

VelocityDbList(T).RemoveAt Method

Removes an item at a specified index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void RemoveAt (  
    int index  
)
```

VB

```
Public Overridable Sub RemoveAt (  
    index As Integer  
)
```

C++

```
public:  
virtual void RemoveAt (  
    int index  
)
```

F#

```
abstract RemoveAt :  
    index : int -> unit  
override RemoveAt :  
    index : int -> unit
```

Parameters

index

Type: [System.Int32](#)

the index of the item to remove

Implements

[IList\(T\).RemoveAt\(Int32\)](#)

See Also

)
```

F#

```
abstract RemoveRange :  
    index : int *  
    howMany : int -> unit  
override RemoveRange :  
    index : int *  
    howMany : int -> unit
```

Parameters

index

Type: [System.Int32](#)

start index

howMany

Type: [System.Int32](#)

how many to remove

        interface ICollection<'T>  
        interface IEnumerable<'T>  
        interface IEnumerable  
    end
```

Type Parameters

T

The element type of a list.

The VelocityDbListOidShort(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------------|---------------------------------------------|
|  | VelocityDbListOidShort(T) | Creates a new list with a presized capacity |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-------------------------------------------------------------------------|
|  | MaxNumberOfDatabases | (Overrides OptimizedPersistable.MaxNumberOfDatabases.) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | Get(T) | (Defined by GraphHelpers.) |
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

```

C++

```
[SerializableAttribute]
generic<typename T>
where T : IOptimizedPersistable
public ref class WeakReferenceList : public WeakReferenceListBase<T>,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type WeakReferenceList<'T when 'T : IOptimizedPersistable> =
    class
        inherit WeakReferenceListBase<'T>
        interface IList<'T>
        interface ICollection<'T>
        interface IEnumerable<'T>
        interface IEnumerable
    end
```

Type Parameters

T

The type of objects contained in this kind of list

The WeakReferenceList(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|------------------------------------------------|
|  | WeakReferenceList(T) | Constructs a new list with a presized capacity |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|--------------------------------------------------------------------------------------------------------------------|
|  | Count | Number of items in list (Overrides WeakReferenceListBase(T).Count.) |
|  | Item | Gets or sets an item at a certain index (Overrides WeakReferenceListBase(T).Item(Int32).) |
|  | ObjectsPerPage | Limit to 1000 per page (instead of default 4000) (Overrides OptimizedPersistable.ObjectsPerPage.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Add | Adds an item to a list (Overrides WeakReferenceListBase(T).Add(T).) |
|  | AddRange | Adds the elements of the given collection to the end of this list. (Overrides WeakReferenceListBase(T).AddRange(IEnumerable(T)).) |
|  | Clear | Removes all items from the list and frees the array (Overrides WeakReferenceListBase(T).Clear().) |
|  | Insert | Inserts an item at a specified index (Overrides WeakReferenceListBase(T).Insert(Int32, T).) |
|  | InsertRange | Inserts the elements of the given collection at a given index. (Overrides WeakReferenceListBase(T).InsertRange(Int32, IEnumerable(T)).) |
|  | Remove | Remove an item (Overrides WeakReferenceListBase(T).Remove(T).) |
|  | RemoveAt | Removes an item at a specified index (Overrides WeakReferenceListBase(T).RemoveAt(Int32).) |
|  | RemoveRange | Removes a range of items (Overrides WeakReferenceListBase(T).RemoveRange(Int32, Int32).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------|---------------------------------------------------------------------------------|
|  | Get(T) | (Defined by GraphHelpers.) |
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |

VelocityDB Class Library

| | | |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|

WeakReferenceList(T) Constructor

Constructs a new list with a presized capacity

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public WeakReferenceList(  
    int capacity = 1,  
    SessionBase session = null  
)
```

VB

```
Public Sub New (  
    Optional capacity As Integer = 1,  
    Optional session As SessionBase = Nothing  
)
```

C++

```
public:  
WeakReferenceList(  
    int capacity = 1,  
    SessionBase^ session = nullptr  
)
```

F#

```
new :  
    ?capacity : int *  
    ?session : SessionBase  
(* Defaults:  
    let _capacity = defaultArg capacity 1  
    let _session = defaultArg session null  
)  
-> WeakReferenceList
```

Parameters

capacity (Optional)

Type: [System.Int32](#)

Reserve space for this many elements

session (Optional)

Type: [VelocityDb.Session.SessionBase](#)

Active session

[VelocityDb.Collection Namespace](#)

WeakReferenceList(T).Remove Method

Remove an item

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool Remove (  
    T item  
)
```

VB

```
Public Overrides Function Remove (  
    item As T  
) As Boolean
```

C++

```
public:  
virtual bool Remove (  
    T item  
) override
```

F#

```
abstract Remove :  
    item : 'T -> bool  
override Remove :  
    item : 'T -> bool
```

Parameters

item

Type: *T*

the item to remove

Return Value

Type: [Boolean](#)

true if item was found and removed; otherwise false

Implements

[ICollection\(T\).Remove\(T\)](#)

[ICollection\(T\).Remove\(T\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------|--------------------------------------------------|
| NotSupportedException | The ICollection(T) is read-only. |

VelocityDB Class Library

See Also

[WeakReferenceList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceList(T).RemoveAt Method

Removes an item at a specified index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void RemoveAt (
    int index
)
```

VB

```
Public Overrides Sub RemoveAt (
    index As Integer
)
```

C++

```
public:
virtual void RemoveAt (
    int index
) override
```

F#

```
abstract RemoveAt :
    index : int -> unit
override RemoveAt :
    index : int -> unit
```

Parameters

index

Type: [System.Int32](#)

the index of the item to remove

Implements

[IList\(T\).RemoveAt\(Int32\)](#)

[IList\(T\).RemoveAt\(Int32\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------------|---------------------------------------------------------------------|
| ArgumentOutOfRangeException | <i>index</i> is not a valid index in the IList(T) . |
| NotSupportedException | The IList(T) is read-only. |

WeakReferenceList(T).RemoveRange Method

Removes a range of items

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void RemoveRange (  
    int index,  
    int howMany  
)
```

VB

```
Public Overrides Sub RemoveRange (  
    index As Integer,  
    howMany As Integer  
)
```

C++

```
public:  
virtual void RemoveRange (  
    int index,  
    int howMany  
) override
```

F#

```
abstract RemoveRange :  
    index : int *  
    howMany : int -> unit  
override RemoveRange :  
    index : int *  
    howMany : int -> unit
```

Parameters

index

Type: [System.Int32](#)

start index

howMany

Type: [System.Int32](#)

how many to remove

See Also

[WeakReferenceList\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T) Class

List with an Id containing object Ids ordered by index.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Collection.WeakReferenceListBase(T)

[VelocityDb.Collection.WeakReferenceList\(T\)](#)

[VelocityDb.Collection.WeakShortReferenceList\(T\)](#)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public abstract class WeakReferenceListBase<T> : OptimizedPersistable,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
where T : IOptimizedPersistable
```

VB

```
<SerializableAttribute>
Public MustInherit Class WeakReferenceListBase(Of T As IOptimizedPersistable)
    Inherits OptimizedPersistable
    Implements IList(Of T), ICollection(Of T),
    IEnumerable(Of T), IEnumerable
```

C++

```
[SerializableAttribute]
generic<typename T>
where T : IOptimizedPersistable
public ref class WeakReferenceListBase abstract : public
    OptimizedPersistable,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
```

F#

```
[<AbstractClassAttribute>]
[<SerializableAttribute>]
type WeakReferenceListBase<'T when 'T : IOptimizedPersistable> =
    class
        inherit OptimizedPersistable
        interface IList<'T>
        interface ICollection<'T>
        interface IEnumerable<'T>
        interface IEnumerable
    end
```

Type Parameters

T

The type of objects contained in this kind of list

The WeakReferenceListBase(T) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|-----------------------------------------|
|  | Count | Number of items in list |
|  | IsFixedSize | Always false |
|  | IsReadOnly | Always false |
|  | IsSynchronized | Always false |
|  | Item | Gets or sets an item at a certain index |
|  | SyncRoot | Used for thread safety |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Add | Adds an item to a list |
|  | AddRange | Adds the elements of the given collection to the end of this list. |
|  | BinarySearch | Searches the entire sorted list for an element using the default comparer and returns the zero-based index of the element. |
|  | Clear | Removes all items from the list and frees the array |
|  | ClearAndUnpersistContainedObjects | Removes all items from the list and unpersists all contained objects |
|  | Contains | Checks if an item is contained in the list |
|  | CopyTo(Array, Int32) | Copies list to an array |
|  | CopyTo(T[], Int32) | Copies list items to an array |
|  | GetEnumerator | Returns an enumerator that iterates through the collection. |
|  | IndexOf | Finds the first index of an item |
|  | Insert | Inserts an item at a specified index |
|  | InsertRange | Inserts the elements of the given collection at a given index. |
|  | Last | Get the value at the last position in the list |
|  | Persist | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. (Overrides OptimizedPersistable.Persist(Placement, |

| | | |
|-----------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | SessionBase , Boolean , Boolean , Queue(IOptimizedPersistable).) |
|  | Remove | Remove an item |
|  | RemoveAt | Removes an item at a specified index |
|  | RemoveRange | Removes a range of items |
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase).) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | Get(T) | (Defined by GraphHelpers.) |
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

WeakReferenceListBase(T).Count Property

Number of items in list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract int Count { get; }
```

VB

```
Public MustOverride ReadOnly Property Count As Integer  
    Get
```

C++

```
public:  
virtual property int Count {  
    int get () abstract;  
}
```

F#

```
abstract Count : int with get
```

Property Value

Type: [Int32](#)

Implements

[ICollection\(T\).Count](#)

See Also

WeakReferenceListBase(T).Item Property

Gets or sets an item at a certain index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract T this[
    int index
] { get; set; }
```

VB

```
Public MustOverride Default Property Item (
    index As Integer
) As T
    Get
    Set
```

C++

```
public:
virtual property T default[int index] {
    T get (int index) abstract;
    void set (int index, T value) abstract;
}
```

F#

```
abstract Item : 'T with get, set
```

Parameters

index

Type: [System.Int32](#)

the item index

Return Value

Type: *T*

the item at the specified index

Implements

[IList\(T\).Item\(Int32\)](#)

See Also

WeakReferenceListBase(T).WeakReferenceListBase(T) Methods

The [WeakReferenceListBase\(T\)](#) generic type exposes the following members.

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Add | Adds an item to a list |
|  AddRange | Adds the elements of the given collection to the end of this list. |
|  BinarySearch | Searches the entire sorted list for an element using the default comparer and returns the zero-based index of the element. |
|  Clear | Removes all items from the list and frees the array |
|  ClearAndUnpersistContainedObjects | Removes all items from the list and unpersists all contained objects |
|  Contains | Checks if an item is contained in the list |
|  CopyTo(Array, Int32) | Copies list to an array |
|  CopyTo(T[], Int32) | Copies list items to an array |
|  GetEnumerator | Returns an enumerator that iterates through the collection. |
|  IndexOf | Finds the first index of an item |
|  Insert | Inserts an item at a specified index |
|  InsertRange | Inserts the elements of the given collection at a given index. |
|  Last | Get the value at the last position in the list |
|  Persist | Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way. (Overrides OptimizedPersistable.Persist(Placement, SessionBase, Boolean, Boolean, Queue(IOptimizedPersistable)).) |
|  Remove | Remove an item |
|  RemoveAt | Removes an item at a specified index |
|  RemoveRange | Removes a range of items |
|  Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase).) |

WeakReferenceListBase(T).Add Method

Adds an item to a list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract void Add(  
    T item  
)
```

VB

```
Public MustOverride Sub Add (  
    item As T  
)
```

C++

```
public:  
virtual void Add(  
    T item  
) abstract
```

F#

```
abstract Add :  
    item : 'T -> unit
```

Parameters

item

Type: *T*

item being added

Implements

[ICollection\(T\).Add\(T\)](#)

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).AddRange Method

Adds the elements of the given collection to the end of this list.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract void AddRange (  
    IEnumerable<T> collection  
)
```

VB

```
Public MustOverride Sub AddRange (  
    collection As IEnumerable(Of T)  
)
```

C++

```
public:  
virtual void AddRange (  
    IEnumerable<T>^ collection  
) abstract
```

F#

```
abstract AddRange :  
    collection : IEnumerable<'T> -> unit
```

Parameters

collection

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

to be added

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).BinarySearch Method

Searches the entire sorted list for an element using the default comparer and returns the zero-based index of the element.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int BinarySearch(  
    T aKey,  
    out bool isEqual  
)
```

VB

```
Public Function BinarySearch (  
    aKey As T,  
    <OutAttribute> ByRef isEqual As Boolean  
) As Integer
```

C++

```
public:  
int BinarySearch(  
    T aKey,  
    [OutAttribute] bool% isEqual  
)
```

F#

```
member BinarySearch :  
    aKey : 'T *  
    isEqual : bool byref -> int
```

Parameters

aKey

Type: *T*

The object to locate

isEqual

Type: [System.Boolean](#)

True if match is found; otherwise false

Return Value

Type: [Int32](#)

The index of the object if found; otherwise index at which located would be located

Removes all items from the list and unpersists all contained objects

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void ClearAndUnpersistContainedObjects (
    SessionBase session
)
```

VB

```
Public Overridable Sub ClearAndUnpersistContainedObjects (
    session As SessionBase
)
```

C++

```
public:
virtual void ClearAndUnpersistContainedObjects (
    SessionBase^ session
)
```

F#

```
abstract ClearAndUnpersistContainedObjects :
    session : SessionBase -> unit
override ClearAndUnpersistContainedObjects :
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for "M:VelocityDb.Collection.WeakReferenceListBase`1.ClearAndUnpersistContainedObjects(VelocityDb.Session.SessionBase)"]

WeakReferenceListBase(T).CopyTo Method (Array, Int32)

Copies list to an array

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    Array array,  
    int arrayIndex  
)
```

VB

```
Public Sub CopyTo (  
    array As Array,  
    arrayIndex As Integer  
)
```

C++

```
public:  
void CopyTo(  
    Array^ array,  
    int arrayIndex  
)
```

F#

```
member CopyTo :  
    array : Array *  
    arrayIndex : int -> unit
```

Parameters

array

Type: [System.Array](#)

the array to copy to

arrayIndex

Type: [System.Int32](#)

start index in array for copy

See Also

[WeakReferenceListBase\(T\) Class](#)

[CopyTo Overload](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).CopyTo Method (T[], Int32)

Copies list items to an array

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    T[] array,  
    int arrayIndex  
)
```

VB

```
Public Sub CopyTo (  
    array As T(),  
    arrayIndex As Integer  
)
```

C++

```
public:  
virtual void CopyTo(  
    array<T>^ array,  
    int arrayIndex  
) sealed
```

F#

```
abstract CopyTo :  
    array : 'T[] *  
    arrayIndex : int -> unit  
override CopyTo :  
    array : 'T[] *  
    arrayIndex : int -> unit
```

Parameters

array

Type: *T*[]

the array to copy to

arrayIndex

Type: [System.Int32](#)

start array index of copy

Implements

[ICollection\(T\).CopyTo\(T\[\], Int32\)](#)

VelocityDB Class Library

[CopyTo Overload](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerator<T> GetEnumerator ()
```

VB

```
Public Function GetEnumerator As IEnumerator(Of T)
```

C++

```
public:  
virtual IEnumerator<T>^ GetEnumerator () sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerator<'T>  
override GetEnumerator : unit -> IEnumerator<'T>
```

Return Value

Type: [IEnumerator\(T\)](#)

An enumerator that can be used to iterate through the collection.

Implements

[IEnumerable\(T\).GetEnumerator\(\)](#)

See Also

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).IndexOf Method

Finds the first index of an item

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int IndexOf(  
    T item  
)
```

VB

```
Public Function IndexOf (  
    item As T  
) As Integer
```

C++

```
public:  
virtual int IndexOf(  
    T item  
) sealed
```

F#

```
abstract IndexOf :  
    item : 'T -> int  
override IndexOf :  
    item : 'T -> int
```

Parameters

item

Type: *T*

item to look for

Return Value

Type: [Int32](#)

-1 if item was not found or first index of item

Implements

[IList\(T\).IndexOf\(T\)](#)

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).Insert Method

Inserts an item at a specified index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract void Insert(  
    int index,  
    T item  
)
```

VB

```
Public MustOverride Sub Insert (  
    index As Integer,  
    item As T  
)
```

C++

```
public:  
virtual void Insert(  
    int index,  
    T item  
) abstract
```

F#

```
abstract Insert :  
    index : int *  
    item : 'T -> unit
```

Parameters

index

Type: [System.Int32](#)

insert at this index

item

Type: *T*

the item being inserted

Implements

[IList\(T\).Insert\(Int32, T\)](#)

See Also

[WeakReferenceListBase\(T\) Class](#)

VelocityDB Class Library

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).InsertRange Method

Inserts the elements of the given collection at a given index.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract void InsertRange(  
    int index,  
    IEnumerable<T> collection  
)
```

VB

```
Public MustOverride Sub InsertRange (  
    index As Integer,  
    collection As IEnumerable(Of T)  
)
```

C++

```
public:  
virtual void InsertRange(  
    int index,  
    IEnumerable<T>^ collection  
) abstract
```

F#

```
abstract InsertRange :  
    index : int *  
    collection : IEnumerable<'T> -> unit
```

Parameters

index

Type: [System.Int32](#)

start insert at this index

collection

Type: [System.Collections.Generic.IEnumerable\(T\)](#)

to be inserted

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).Last Method

Get the value at the last position in the list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public T Last ()
```

VB

```
Public Function Last As T
```

C++

```
public:  
T Last ()
```

F#

```
member Last : unit -> 'T
```

Return Value

Type: *T*

The value at the last position in the list

See Also

[WeakReferenceListBase\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).Persist Method

Persists this object. Override in your subclasses when you want fields of your class to be persisted in some special way.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ulong Persist(
    Placement place,
    SessionBase session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable> toPersist = null
)
```

VB

```
Public Overrides Function Persist (
    place As Placement,
    session As SessionBase,
    Optional persistRefs As Boolean = true,
    Optional disableFlush As Boolean = false,
    Optional toPersist As Queue(Of IOptimizedPersistable) = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    Placement^ place,
    SessionBase^ session,
    bool persistRefs = true,
    bool disableFlush = false,
    Queue<IOptimizedPersistable^>^ toPersist = nullptr
) override
```

F#

```
abstract Persist :
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let _persistRefs = defaultArg persistRefs true
    let _disableFlush = defaultArg disableFlush false
    let _toPersist = defaultArg toPersist null
*)
-> uint64
override Persist :
```

```
    place : Placement *
    session : SessionBase *
    ?persistRefs : bool *
    ?disableFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_persistRefs = defaultArg persistRefs true
    let_disableFlush = defaultArg disableFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

The placement rules to follow when persisting this object

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

persistRefs (Optional)

Type: [System.Boolean](#)

If true, objects referenced from this object will also be persisted

disableFlush (Optional)

Type: [System.Boolean](#)

If true, disables possible flushing of updated pages while persisting this object; otherwise page flushing may occur

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A queue of objects remaining to be persisted. Pass as a parameter to session.Persist

Return Value

Type: [UInt64](#)

The object id of this persistent object

Implements

[IOptimizedPersistable.Persist\(Placement, SessionBase, Boolean, Boolean, Queue<IOptimizedPersistable>\)](#)

See Also

[WeakReferenceListBase\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).Remove Method

Remove an item

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract bool Remove (  
    T item  
)
```

VB

```
Public MustOverride Function Remove (  
    item As T  
) As Boolean
```

C++

```
public:  
virtual bool Remove (  
    T item  
) abstract
```

F#

```
abstract Remove :  
    item : 'T -> bool
```

Parameters

item

Type: *T*

the item to remove

Return Value

Type: [Boolean](#)

true if item was found and removed; otherwise false

Implements

[ICollection\(T\).Remove\(T\)](#)

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).RemoveAt Method

Removes an item at a specified index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public abstract void RemoveAt (  
    int index  
)
```

```
VB  
Public MustOverride Sub RemoveAt (  
    index As Integer  
)
```

```
C++  
public:  
virtual void RemoveAt (  
    int index  
) abstract
```

```
F#  
abstract RemoveAt :  
    index : int -> unit
```

Parameters

index

Type: [System.Int32](#)

the index of the item to remove

Implements

[IList\(T\).RemoveAt\(Int32\)](#)

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).RemoveRange Method

Removes a range of items

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract void RemoveRange (  
    int index,  
    int howMany  
)
```

VB

```
Public MustOverride Sub RemoveRange (  
    index As Integer,  
    howMany As Integer  
)
```

C++

```
public:  
virtual void RemoveRange (  
    int index,  
    int howMany  
) abstract
```

F#

```
abstract RemoveRange :  
    index : int *  
    howMany : int -> unit
```

Parameters

index

Type: [System.Int32](#)

start index

howMany

Type: [System.Int32](#)

how many to remove

See Also

[WeakReferenceListBase\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakReferenceListBase(T).Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

[WeakReferenceListBase\(T\)Class](#)

[VelocityDb.Collection Namespace](#)

WeakShortReferenceList(T) Class

List with an Id containing object short Ids (page and slot) ordered by index.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

[VelocityDb.Collection.WeakReferenceListBase\(T\)](#)

VelocityDb.Collection.WeakShortReferenceList(T)

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class WeakShortReferenceList<T> : WeakReferenceListBase<T>,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
where T : IOptimizedPersistable
```

VB

```
<SerializableAttribute>
Public Class WeakShortReferenceList(Of T As IOptimizedPersistable)
    Inherits WeakReferenceListBase(Of T)
    Implements IList(Of T), ICollection(Of T),
    IEnumerable(Of T), IEnumerable
```

C++

```
[SerializableAttribute]
generic<typename T>
where T : IOptimizedPersistable
public ref class WeakShortReferenceList : public WeakReferenceListBase<T>,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type WeakShortReferenceList<'T when 'T : IOptimizedPersistable> =
    class
        inherit WeakReferenceListBase<'T>
        interface IList<'T>
        interface ICollection<'T>
        interface IEnumerable<'T>
        interface IEnumerable
    end
```

Type Parameters

T

The type of objects contained in this kind of list

The WeakShortReferenceList(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------------|------------------------------------------------|
|  | WeakShortReferenceList(T) | Constructs a new list with a presized capacity |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|----------------------------------------------------------------------------------------------------------------------|
|  | Count | Number of items in list (Overrides WeakReferenceListBase(T).Count.) |
|  | Item | Gets or sets an item at a certain index (Overrides WeakReferenceListBase(T).Item(Int32).) |
|  | ObjectsPerPage | Limit to 10000 per page (instead of default 40000) (Overrides OptimizedPersistable.ObjectsPerPage.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Add | Adds an item to a list (Overrides WeakReferenceListBase(T).Add(T).) |
|  | AddRange | Adds the elements of the given collection to the end of this list. (Overrides WeakReferenceListBase(T).AddRange(IEnumerable(T)).) |
|  | Clear | Removes all items from the list and frees the array (Overrides WeakReferenceListBase(T).Clear().) |
|  | Insert | Inserts an item at a specified index (Overrides WeakReferenceListBase(T).Insert(Int32, T).) |
|  | InsertRange | Inserts the elements of the given collection at a given index. (Overrides WeakReferenceListBase(T).InsertRange(Int32, IEnumerable(T)).) |
|  | Remove | Remove an item (Overrides WeakReferenceListBase(T).Remove(T).) |
|  | RemoveAt | Removes an item at a specified index (Overrides WeakReferenceListBase(T).RemoveAt(Int32).) |
|  | RemoveRange | Removes a range of items (Overrides WeakReferenceListBase(T).RemoveRange(Int32, Int32).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------|---------------------------------------------------------------------------------|
|  | Get(T) | (Defined by GraphHelpers.) |
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |

VelocityDB Class Library

| | | |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|

[VelocityDb.Collection Namespace](#)

WeakShortReferenceList(T) Constructor

Constructs a new list with a presized capacity

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public WeakShortReferenceList(  
    int capacity = 1,  
    SessionBase session = null  
)
```

VB

```
Public Sub New (  
    Optional capacity As Integer = 1,  
    Optional session As SessionBase = Nothing  
)
```

C++

```
public:  
WeakShortReferenceList(  
    int capacity = 1,  
    SessionBase^ session = nullptr  
)
```

F#

```
new :  
    ?capacity : int *  
    ?session : SessionBase  
(* Defaults:  
    let _capacity = defaultArg capacity 1  
    let _session = defaultArg session null  
)  
-> WeakShortReferenceList
```

Parameters

capacity (Optional)

Type: [System.Int32](#)

Reserve space for this many elements

session (Optional)

Type: [VelocityDb.Session.SessionBase](#)

Active session

WeakShortReferenceList(T).Count Property

Number of items in list

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override int Count { get; }
```

VB

```
Public Overrides ReadOnly Property Count As Integer  
    Get
```

C++

```
public:  
virtual property int Count {  
    int get () override;  
}
```

F#

```
abstract Count : int with get  
override Count : int with get
```

Return Value

Type: [Int32](#)

The number of elements contained in the [ICollection\(T\)](#).

Implements

[ICollection\(T\).Count](#)

[ICollection\(T\).Count](#)

See Also

[WeakShortReferenceList\(T\) Class](#)

[VelocityDb.Collection Namespace](#)

WeakShortReferenceList(T).Item Property

Gets or sets an item at a certain index

Namespace: [VelocityDb.Collection](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override T this[
    int index
] { get; set; }
```

VB

```
Public Overrides Default Property Item (
    index As Integer
) As T
    Get
    Set
```

C++

```
public:
virtual property T default[int index] {
    T get (int index) override;
    void set (int index, T value) override;
}
```

F#

```
abstract Item : 'T with get, set
override Item : 'T with get, set
```

Parameters

index

Type: [System.Int32](#)

the item index

Return Value

Type: *T*

the item at the specified index

Implements

[IList\(T\).Item\(Int32\)](#)

[IList\(T\).Item\(Int32\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------------|------------------------------------------------------------------------|
| ArgumentOutOfRangeException | <i>index</i> is not a valid index in the IList(T) . |
| NotSupportedException | The property is set and the IList(T) is read-only. |

```
abstract Insert :  
    index : int *  
    item : 'T -> unit  
override Insert :  
    index : int *  
    item : 'T -> unit
```

Parameters

index

Type: [System.Int32](#)

insert at this index

item

Type: *T*

the item being inserted

Implements

[IList\(T\).Insert\(Int32, T\)](#)

[IList\(T\).Insert\(Int32, T\)](#)

Exceptions

| Exception | Condition |
|---------------------------------------------|---------------------------------------------------------------------|
| ArgumentOutOfRangeException | <i>index</i> is not a valid index in the IList(T) . |
| NotSupportedException | The IList(T) is read-only. |

[VelocityDb.Collection Namespace](#)

VelocityDb.Collection.BTree Namespace

The `VelocityDb.Collection.BTree` namespace contains classes for the VelocityDb BTrees optimized for persistent storage in VelocityDb databases

Classes

| Class | Description |
|-----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AssemblyExtensions | |
| BTreeBase(Key, Value) | Represents a collection of objects that is maintained in sorted order. |
| BTreeByteArray | Wrapper object for a byte[] of data for comparing objects within a BTreeSet. Wrapper is used so that this data can be placed on a separate Page |
| BTreeInternal(Key, Value) | Represents a collection of keys that is maintained in sorted order. Each key has an associated value. A persistent BTree references its contained objects by Oid instead of direct object references. This way, we will only open the referenced objects on demand which reduces memory usage and initial BTree load time. Exceptions are ValueType keys and values. |
| BTreeInternalBase(Key, Value) | Represents a collection of keys that is maintained in sorted order. Each key has an associated value. A persistent BTree references its contained objects by Oid instead of direct object references. This way, we will only open the referenced objects on demand which reduces memory usage and initial BTree load time. Exceptions are ValueType keys and values. |
| BTreeLeaf(Key, Value) | Creates a leaf level node in the BTree |
| BTreeLeafBase(Key, Value) | Internal class used with BTreeSet and BTreeMap |
| BTreeMap(Key, Value) | Represents a collection of keys that is maintained in sorted order. Each key has an associated value. A persistent BTree references its contained objects by Oid instead of direct object references. This way, we will only open the referenced objects on demand which reduces memory usage and initial BTree load time. Exceptions are ValueType keys and values. |
| BTreeMapBase(Key, Value) | Represents a collection of objects that is maintained in sorted order. |
| BTreeMapIterator(Key, Value) | Iterates all the elements of a BTreeSet |
| BTreeMapOidShort(Key, Value) | Represents a collection of objects that is maintained in sorted order. Collection and all objects must be within a single Database (since references uses OidShort persistently) |
| BTreeNode | A BTree consists of a tree of nodes. Each BTree node has this class a base class. |
| BTreeSet(Key) | Represents a collection of objects that is maintained in sorted order. A persistent BTree references its contained objects by Oid instead of direct object references. This way, we will only open the referenced objects on demand which reduces memory usage and initial BTree load time. |

VelocityDB Class Library

| | |
|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  BTreeSetIterator(Key) | Iterates all the elements of a BTreeSet |
|  BTreeSetOidShort(Key) | Represents a collection of objects that is maintained in sorted order. Collection and all objects must be within a single Database (since references uses OidShort persistently) |

AssemblyExtensions Class

[Missing <summary> documentation for "T:VelocityDb.Collection.BTree.AssemblyExtensions"]

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Collection.BTree.AssemblyExtensions

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static class AssemblyExtensions
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class AssemblyExtensions
```

C++

```
[ExtensionAttribute]  
public ref class AssemblyExtensions abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type AssemblyExtensions = class end
```

The **AssemblyExtensions** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------------|-------------|
|  | GetLoadableTypes | |

See Also

AssemblyExtensions.GetLoadableTypes Method

[Missing <summary> documentation for

"M:VelocityDb.Collection.BTree.AssemblyExtensions.GetLoadableTypes(System.Reflection.Assembly)"]

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IEnumerable<Type> GetLoadableTypes (  
    this Assembly assembly  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Function GetLoadableTypes (  
    assembly As Assembly  
) As IEnumerable(Of Type)
```

C++

```
public:  
[ExtensionAttribute]  
static IEnumerable<Type^> GetLoadableTypes (  
    Assembly^ assembly  
)
```

F#

```
[<ExtensionAttribute>]  
static member GetLoadableTypes :  
    assembly : Assembly -> IEnumerable<Type>
```

Parameters

assembly

Type: [System.Reflection.Assembly](#)

[Missing <param name="assembly"/> documentation for

"M:VelocityDb.Collection.BTree.AssemblyExtensions.GetLoadableTypes(System.Reflection.Assembly)"]

Return Value

Type: [IEnumerable\(Type\)](#)

[Missing <returns> documentation for

"M:VelocityDb.Collection.BTree.AssemblyExtensions.GetLoadableTypes(System.Reflection.Assembly)"]

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [Assembly](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public abstract class BTreeBase<Key, Value> : BTreeNode,  
    IEnumerable<Key>, IEnumerable
```

VB

```
<SerializableAttribute>  
Public MustInherit Class BTreeBase(Of Key, Value)  
    Inherits BTreeNode  
    Implements IEnumerable(Of Key), IEnumerable
```

C++

```
[SerializableAttribute]  
generic<typename Key, typename Value>  
public ref class BTreeBase abstract : public BTreeNode,  
    IEnumerable<Key>, IEnumerable
```

F#

```
[<AbstractClassAttribute>]  
[<SerializableAttribute>]  
type BTreeBase<'Key, 'Value> =  
    class  
        inherit BTreeNode  
        interface IEnumerable<'Key>  
        interface IEnumerable  
    end
```

Type Parameters

Key

The type of key objects in this BTree

Value

The type of value objects in a BTreeMap or BTreeMapOidShort

The BTreeBase(Key, Value) type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the VelocityDbComparer(Of Key) that is used to determine the order of the items in the sorted set |
|  | ComparisonArraySize | Gets the size of a comparison array used by this set. |
|  | Count | Gets the number of elements in the set. |
|  | Depth | Gets the depth of the BTreeSet |
|  | FlushIfPageFull | We don't want to flush other BTree pages while looking for a placement page (Overrides OptimizedPersistable.FlushIfPageFull.) |
|  | GetAlternateComparer | If comparer isn't set then if Key type is string use SessionBase.DefaultStringComparer or ... |
|  | IsLeaf | Is the root a leaf node or not? |
|  | KeyPlacement | Set the key placement to be used for all key objects added to this. This setting is not persisted, it is mainly to be used with objects added with AddFast(Key) |
|  | NodeSize | The size of the nodeList or the keyList (if depth is 1) of the root node. |
|  | ObjectsPerPage | Limit to 1000 per page (instead of default 40000) (Overrides OptimizedPersistable.ObjectsPerPage.) |
|  | ToDoBatchAddCount | Gets the number of objects that are not yet added to the collection |
|  | TransientBatchSize | Get/Set the max batch size used in API such as AddFast(Key) |
|  | UsesOidShort | Does this BTree use short object references (32 bit) for its internal references? |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Add(Key) | Adds an element to the set and returns a value that indicates if it was successfully added |
|  | Add(Key, Value) | Add a key with an associated value to a BTreeMap |
|  | Add(Key, Value, Byte[]) | Adds a key and value to the map and returns a value that indicates if it was successfully added |
|  | AddFast | Adds an element to an array of to be added objects. The objects in this array are added when a call to FlushTransients() is triggered by multiple events such as calling Count and when collection is committed and/or flushed to disk or when the array is full. The array size is by default |

| | | |
|-------------------------------------------------------------------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | currently BTreeAddFastTransientBatchSize but you can get/set the desired size with TransientBatchSize |
|  | AddWithComparisonArray | Adds an element to the set and returns a value that indicates if it was successfully added |
|  | Clear | Removes all elements from the set. |
|  | Contains(Key) | Determines whether the set contains a specific element. |
|  | Contains(Key,Byte[]) | Determines whether the set contains a specific element. |
|  | CopyTo | Copies a range of elements from the BTreeBase to a compatible one-dimensional array, starting at the specified index of the target array. |
|  | FlushTransients | Adds all queued up to be added objects after presorting them transiently (Overrides OptimizedPersistable.FlushTransients().) |
|  | GetEnumerator | Enumerates all contained Key objects in sorted order |
|  | GetKeyId(Key) | When Key type implements IOptimizedPersistable , you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. To avoid opening the object, a comparison array which is flagged as complete key must be used. |
|  | GetKeyId(Key,Byte[]) | When Key type implements IOptimizedPersistable , you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. To avoid opening the object, a comparison array which is flagged as complete key must be used. |
|  | InitializeAfterRead | Sets up some transient variables (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase).) |
|  | InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  | InitNew | Internal use only |
|  | Iterator | Initializes an iterator to find the keys of this set |
|  | Remove(Key) | Removes a specified item from the set. |
|  | Remove(Key,Byte[]) | Removes a specified item from the set. |
|  | SearchTransients | |
|  | TryGetKey(Key, Key) | Gets the value matching persistent key with the specified key. |
|  | TryGetKey(Key,Byte[], Key) | Gets the value associated with the specified key. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

BTreeBase(Key, Value).BTreeBase(Key, Value) Methods

The [BTreeBase\(Key, Value\)](#) generic type exposes the following members.

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Add(Key) | Adds an element to the set and returns a value that indicates if it was successfully added |
|  Add(Key, Value) | Add a key with an associated value to a BTreeMap |
|  Add(Key, Value,Byte[]) | Adds a key and value to the map and returns a value that indicates if it was successfully added |
|  AddFast | Adds an element to an array of to be added objects. The objects in this array are added when a call to FlushTransients() is triggered by multiple events such as calling Count and when collection is committed and/or flushed to disk or when the array is full. The array size is by default currently BTreeAddFastTransientBatchSize but you can get/set the desired size with TransientBatchSize |
|  AddWithComparisonArray | Adds an element to the set and returns a value that indicates if it was successfully added |
|  Clear | Removes all elements from the set. |
|  Contains(Key) | Determines whether the set contains a specific element. |
|  Contains(Key,Byte[]) | Determines whether the set contains a specific element. |
|  CopyTo | Copies a range of elements from the BTreeBase to a compatible one-dimensional array, starting at the specified index of the target array. |
|  FlushTransients | Adds all queued up to be added objects after presorting them transiently (Overrides OptimizedPersistable.FlushTransients().) |
|  GetEnumerator | Enumerates all contained Key objects in sorted order |
|  GetKeyId(Key) | When Key type implements IOptimizedPersistable , you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. To avoid opening the object, a comparison array which is flagged as complete key must be used. |
|  GetKeyId(Key,Byte[]) | When Key type implements IOptimizedPersistable , you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. To avoid opening the object, a comparison array which is flagged as complete key must be used. |
|  InitializeAfterRead | Sets up some transient variables (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase).) |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide |

| | | |
|-----------------------------------------------------------------------------------|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| | | your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  | InitNew | Internal use only |
|  | Iterator | Initializes an iterator to find the keys of this set |
|  | Remove(Key) | Removes a specified item from the set. |
|  | Remove(Key,Byte[]) | Removes a specified item from the set. |
|  | SearchTransients | |
|  | TryGetKey(Key, Key) | Gets the value matching persistent key with the specified key. |
|  | TryGetKey(Key,Byte[], Key) | Gets the value associated with the specified key. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).Add Method (Key)

Adds an element to the set and returns a value that indicates if it was successfully added

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Add(  
    Key key  
)
```

VB

```
Public Function Add (  
    key As Key  
) As Boolean
```

C++

```
public:  
virtual bool Add(  
    Key key  
) sealed
```

F#

```
abstract Add :  
    key : 'Key -> bool  
override Add :  
    key : 'Key -> bool
```

Parameters

key

Type: *Key*

The object being added

Return Value

Type: [Boolean](#)

true if an element was added; otherwise, false.

See Also

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).Add Method (Key, Value)

Add a key with an associated value to a BTreeMap

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Add(  
    Key key,  
    Value value  
)
```

VB

```
Public Sub Add (  
    key As Key,  
    value As Value  
)
```

C++

```
public:  
virtual void Add(  
    Key key,  
    Value value  
) sealed
```

F#

```
abstract Add :  
    key : 'Key *  
    value : 'Value -> unit  
override Add :  
    key : 'Key *  
    value : 'Value -> unit
```

Parameters

key

Type: *Key*

The key added

value

Type: *Value*

The associated value added

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).Add Method (Key, Value, Byte[])

Adds a key and value to the map and returns a value that indicates if it was successfully added

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Add(  
    Key key,  
    Value value,  
    byte[] comparisonArrayIn  
)
```

VB

```
Public Sub Add (  
    key As Key,  
    value As Value,  
    comparisonArrayIn As Byte()  
)
```

C++

```
public:  
void Add(  
    Key key,  
    Value value,  
    array<unsigned char>^ comparisonArrayIn  
)
```

F#

```
member Add :  
    key : 'Key *  
    value : 'Value *  
    comparisonArrayIn : byte[] -> unit
```

Parameters

key

Type: *Key*

[Missing <param name="key"/> documentation for

"M:VelocityDb.Collection.BTree.BTreeBase`2.Add(`0,`1,System.Byte[])"]

value

Type: *Value*

[Missing <param name="value"/> documentation for

"M:VelocityDb.Collection.BTree.BTreeBase`2.Add(`0,`1,System.Byte[])"]

comparisonArrayIn

Type: [System.Byte\[\]](#)

[Missing <param name="comparisonArrayIn"/> documentation for "M:VelocityDb.Collection.BTree.BTreeBase`2.Add(`0,`1,System.Byte[])"]

Return Value

Type:

true if an element was added; otherwise, false.

[BTreeBase\(Key, Value\)Class](#)

[Add Overload](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).AddFast Method

Adds an element to an array of to be added objects. The objects in this array are added when a call to [FlushTransients\(\)](#) is triggered by multiple events such as calling [Count](#) and when collection is committed and/or flushed to disk or when the array is full. The array size is by default currently [BTreeAddFastTransientBatchSize](#) but you can get/set the desired size with [TransientBatchSize](#)

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void AddFast (  
    Key key  
)
```

VB

```
Public Sub AddFast (  
    key As Key  
)
```

C++

```
public:  
void AddFast (  
    Key key  
)
```

F#

```
member AddFast :  
    key : 'Key -> unit
```

Parameters

key

Type: *Key*

The object being added

See Also

BTreeBase(Key, Value).AddWithComparisonArray Method

Adds an element to the set and returns a value that indicates if it was successfully added

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool AddWithComparisonArray(  
    Key key,  
    byte[] comparisonArrayIn  
)
```

VB

```
Public Function AddWithComparisonArray (  
    key As Key,  
    comparisonArrayIn As Byte ()  
) As Boolean
```

C++

```
public:  
bool AddWithComparisonArray(  
    Key key,  
    array<unsigned char>^ comparisonArrayIn  
)
```

F#

```
member AddWithComparisonArray :  
    key : 'Key *  
    comparisonArrayIn : byte[] -> bool
```

Parameters

key

Type: *Key*

[Missing <param name="key"/> documentation for

"M:VelocityDb.Collection.BTree.BTreeBase`2.AddWithComparisonArray(`0,System.Byte[])"]

comparisonArrayIn

Type: [System.Byte\[\]](#)

[Missing <param name="comparisonArrayIn"/> documentation for

"M:VelocityDb.Collection.BTree.BTreeBase`2.AddWithComparisonArray(`0,System.Byte[])"]

Return Value

Type: [Boolean](#)

true if an element was added; otherwise, false.

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).CopyTo Method

Copies a range of elements from the BTreeBase to a compatible one-dimensional array, starting at the specified index of the target array.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    Key[] array,  
    int arrayIndex,  
    int count  
)
```

VB

```
Public Sub CopyTo (  
    array As Key(),  
    arrayIndex As Integer,  
    count As Integer  
)
```

C++

```
public:  
void CopyTo(  
    array<Key>^ array,  
    int arrayIndex,  
    int count  
)
```

F#

```
member CopyTo :  
    array : 'Key[] *  
    arrayIndex : int *  
    count : int -> unit
```

Parameters

array

Type: *Key[]*

The one-dimensional Array that is the destination of the elements copied from BTreeBase. The Array must have zero-based indexing.

arrayIndex

Type: [System.Int32](#)

The zero-based index in the array at which copying begins.

count

VelocityDB Class Library

Type: [System.Int32](#)

The number of elements to copy.

BTreeBase(Key, Value).GetKeyId Method (Key)

When Key type implements [IOptimizedPersistable](#), you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. To avoid opening the object, a comparison array which is flagged as complete key must be used.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong GetKeyId(  
    Key key  
)
```

VB

```
Public Function GetKeyId (  
    key As Key  
) As ULong
```

C++

```
public:  
unsigned long long GetKeyId(  
    Key key  
)
```

F#

```
member GetKeyId :  
    key : 'Key -> uint64
```

Parameters

key

Type: *Key*

Transient lookup object of type *Key* (which in this case must be implementing [IOptimizedPersistable](#))

Return Value

Type: [UInt64](#)

The Id of the corresponding persistent object or 0 if not persistent or not implementing [IOptimizedPersistable](#)

See Also

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong GetKeyId(
    Key key,
    byte[] comparisonArray
)
```

VB

```
Public Function GetKeyId (
    key As Key,
    comparisonArray As Byte()
) As ULong
```

C++

```
public:
    unsigned long long GetKeyId(
        Key key,
        array<unsigned char>^ comparisonArray
    )
```

F#

```
member GetKeyId :
    key : 'Key *
    comparisonArray : byte[] -> uint64
```

Parameters

key

Type: *Key*

Transient lookup object of type *Key* (which in this case must be implementing [IOptimizedPersistable](#))

comparisonArray

Type: [System.Byte\[\]](#)

A byte containing bytes to be compared with.

VelocityDB Class Library

Return Value

Type: [UInt64](#)

The Id of the corresponding persistent object or 0 if not persistent or not implementing [IOptimizedPersistable](#)

BTreeBase(Key, Value).InitializeAfterRead Method

Sets up some transient variables

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRead(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRead (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRead(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRead :  
    session : SessionBase -> unit  
override InitializeAfterRead :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

Implements

[IOptimizedPersistable.InitializeAfterRead\(SessionBase\)](#)

See Also

[BTreeBase\(Key, Value\)Class](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRecreate(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRecreate(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit  
override InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRecreate\(SessionBase\)](#)

See Also

[BTreeBase\(Key, Value\)Class](#)

BTreeBase(Key, Value).InitNew Method

Internal use only

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void InitNew(  
    SessionBase session,  
    ushort maxEntriesPerNode,  
    ushort comparisonArraySize,  
    bool comparisonArrayIsCompleteKey,  
    bool isMap  
)
```

VB

```
Public Sub InitNew (  
    session As SessionBase,  
    maxEntriesPerNode As UShort,  
    comparisonArraySize As UShort,  
    comparisonArrayIsCompleteKey As Boolean,  
    isMap As Boolean  
)
```

C++

```
public:  
void InitNew(  
    SessionBase^ session,  
    unsigned short maxEntriesPerNode,  
    unsigned short comparisonArraySize,  
    bool comparisonArrayIsCompleteKey,  
    bool isMap  
)
```

F#

```
member InitNew :  
    session : SessionBase *  
    maxEntriesPerNode : uint16 *  
    comparisonArraySize : uint16 *  
    comparisonArrayIsCompleteKey : bool *  
    isMap : bool -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for
"M:VelocityDb.Collection.BTree.BTreeBase`2.InitNew(VelocityDb.Session.SessionBase,System.UInt16,
System.UInt16,System.Boolean,System.Boolean)"]

BTreeBase(Key, Value).TryGetKey Method (Key, Key)

Gets the value matching persistent key with the specified key.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TryGetKey(  
    Key key,  
    ref Key value  
)
```

VB

```
Public Function TryGetKey (  
    key As Key,  
    ByRef value As Key  
) As Boolean
```

C++

```
public:  
bool TryGetKey(  
    Key key,  
    Key% value  
)
```

F#

```
member TryGetKey :  
    key : 'Key *  
    value : 'Key byref -> bool
```

Parameters

key

Type: *Key*

The key of the value to get.

value

Type: *Key*

When this method returns, contains the value associated with the specified key, if the key is found; otherwise, the default value for the type of the value parameter. This parameter is passed uninitialized.

Return Value

Type: [Boolean](#)

true if the set contains an element with the specified key; otherwise, false.

VelocityDB Class Library

See Also

[TryGetKey Overload](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeBase(Key, Value).TryGetKey Method (Key, Byte[], Key)

Gets the value associated with the specified key.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TryGetKey(  
    Key key,  
    byte[] comparisonArray,  
    ref Key value  
)
```

VB

```
Public Function TryGetKey (  
    key As Key,  
    comparisonArray As Byte(),  
    ByRef value As Key  
) As Boolean
```

C++

```
public:  
bool TryGetKey(  
    Key key,  
    array<unsigned char>^ comparisonArray,  
    Key% value  
)
```

F#

```
member TryGetKey :  
    key : 'Key *  
    comparisonArray : byte[] *  
    value : 'Key byref -> bool
```

Parameters

key

Type: *Key*

The key of the value to get.

comparisonArray

Type: [System.Byte\[\]](#)

The comparison array associated with the key to get.

value

Type: *Key*

VelocityDB Class Library

When this method returns, contains the value associated with the specified key, if the key is found; otherwise, the default value for the type of the value parameter. This parameter is passed uninitialized.

Return Value

Type: [Boolean](#)

true if the BTreeBase(Of Key) contains an element with the specified key; otherwise, false.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Collection.BTree.BTreeByteArray

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#
[SerializableAttribute]
public class BTreeByteArray : OptimizedPersistable
```

```
VB
<SerializableAttribute>
Public Class BTreeByteArray
    Inherits OptimizedPersistable
```

```
C++
[SerializableAttribute]
public ref class BTreeByteArray : public OptimizedPersistable
```

```
F#
[<SerializableAttribute>]
type BTreeByteArray =
    class
        inherit OptimizedPersistable
    end
```

The **BTreeByteArray** type exposes the following members.

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | We only want this type of object on any page containing this type so don't use pages with other type of objects when placing an object of this type (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|  Cache | We do want to cache this kind of object since they are likely to be frequently used. (Overrides OptimizedPersistable.Cache.) |

| | |
|--------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
|  ObjectsPerPage | Place this type of object on its own page (Overrides OptimizedPersistable.ObjectsPerPage.) |
|  PagesPerDatabase | Use the max limit for this type (Overrides OptimizedPersistable.PagesPerDatabase.) |

Methods

| Name | Description |
|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ReadMe | Used by code generator (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class BTreeInternal<Key, Value> : BTreeInternalBase<Key, Value>
```

VB

```
<SerializableAttribute>
Public Class BTreeInternal(Of Key, Value)
    Inherits BTreeInternalBase(Of Key, Value)
```

C++

```
[SerializableAttribute]
generic<typename Key, typename Value>
public ref class BTreeInternal : public BTreeInternalBase<Key, Value>
```

F#

```
[<SerializableAttribute>]
type BTreeInternal<'Key, 'Value> =
    class
        inherit BTreeInternalBase<'Key, 'Value>
    end
```

Type Parameters

Key

The key type of this collection

Value

The value type of this collection

The BTreeInternal(Key, Value) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------|-------------------------------------------------------------------------------------|
|  | InitializeAfterRead | (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase).) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |

[<SerializableAttribute>]  
type BTreeLeaf<'Key, 'Value> =  
    class  
        inherit BTreeLeafBase<'Key, 'Value>  
    end
```

Type Parameters

Key

Type of keys used

Value

Type of Values used

The BTreeLeaf(Key, Value) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Cache | By default, the an object cache is determined by a SessionBase constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do. (Overrides BTreeLeafBase(Key, Value).Cache.) |
|  | ObjectsPerPage | (Overrides BTreeLeafBase(Key, Value).ObjectsPerPage.) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Cache | By default, the an object cache is determined by a SessionBase constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do. (Overrides BTreeLeafBase(Key, Value).Cache.) |
|  | ObjectsPerPage | (Overrides BTreeLeafBase(Key, Value).ObjectsPerPage.) |

[VelocityDb.Collection.BTree Namespace](#)

BTreeMap(Key, Value) Class

Represents a collection of keys that is maintained in sorted order. Each key has an associated value. A persistent BTree references its contained objects by Oid instead of direct object references. This way, we will only open the referenced objects on demand which reduces memory usage and initial BTree load time. Exceptions are ValueType keys and values.

VelocityDb.Collection.BTree.BTreeMap(Key, Value)

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class BTreeMap<Key, Value> : BTreeMapBase<Key, Value>,
    IEnumerable<KeyValuePair<Key, Value>>, IEnumerable, IEnumerable<Key>,
    IDictionary<Key, Value>, ICollection<KeyValuePair<Key, Value>>
```

VB

```
<SerializableAttribute>
Public Class BTreeMap(Of Key, Value)
    Inherits BTreeMapBase(Of Key, Value)
    Implements IEnumerable(Of KeyValuePair(Of Key, Value)),
    IEnumerable, IEnumerable(Of Key), IDictionary(Of Key, Value),
    ICollection(Of KeyValuePair(Of Key, Value))
```

C++

```
[SerializableAttribute]
generic<typename Key, typename Value>
public ref class BTreeMap : public BTreeMapBase<Key, Value>,
    IEnumerable<KeyValuePair<Key, Value>>, IEnumerable, IEnumerable<Key>,
    IDictionary<Key, Value>, ICollection<KeyValuePair<Key, Value>>
```

F#

```
[<SerializableAttribute>]
type BTreeMap<'Key, 'Value> =
    class
        inherit BTreeMapBase<'Key, 'Value>
        interface IEnumerable<KeyValuePair<'Key, 'Value>>
```

```

interface IEnumerable
interface IEnumerable<'Key>
interface IDictionary<'Key, 'Value>
interface ICollection<KeyValuePair<'Key, 'Value>>
end

```

Type Parameters

Key

The key type of objects in this BTreeMap

Value

The value type of objects in this BTreeMap

The BTreeMap(Key, Value) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|------------------------|
|  | BTreeMap(Key, Value) | Creates a new BTreeSet |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the VelocityDbComparer object that is used to compare Key objects. (Overrides BTreeBase(Key, Value).Comparer.) |
|  | Keys | Gets an ICollection(T) containing the keys of the IDictionary(TKey, TValue) . |
|  | UsesOidShort | Does this BTree use short object references (32 bit) for its internal references? NO it does not. (Overrides BTreeBase(Key, Value).UsesOidShort.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
|  | Clear | Removes all elements from the set. (Overrides BTreeBase(Key, Value).Clear().) |
|  | CopyTo | Copies a range of elements from the BTreeBase to a compatible one-dimensional array, starting at the specified index of the target array. |
|  | InitializeAfterRead | (Overrides BTreeBase(Key, Value).InitializeAfterRead(SessionBase).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

BTreeMap(Key, Value) Constructor

Creates a new BTreeSet

Namespace: [VelocityDb.Collection.BTree](#)**Assembly:** VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public BTreeMap (
    VelocityDbComparer<Key> comparer,
    SessionBase session,
    ushort maxEntriesPerNode = 10000,
    ushort comparisonArraySize = 0,
    bool comparisonArrayIsCompleteKey = false
)
```

VB

```
Public Sub New (
    comparer As VelocityDbComparer(Of Key),
    session As SessionBase,
    Optional maxEntriesPerNode As UShort = 10000,
    Optional comparisonArraySize As UShort = 0,
    Optional comparisonArrayIsCompleteKey As Boolean = false
)
```

C++

```
public:
BTreeMap (
    VelocityDbComparer<Key>^ comparer,
    SessionBase^ session,
    unsigned short maxEntriesPerNode = 10000,
    unsigned short comparisonArraySize = 0,
    bool comparisonArrayIsCompleteKey = false
)
```

F#

```
new :
    comparer : VelocityDbComparer<'Key> *
    session : SessionBase *
    ?maxEntriesPerNode : uint16 *
    ?comparisonArraySize : uint16 *
    ?comparisonArrayIsCompleteKey : bool
(* Defaults:
    let_maxEntriesPerNode = defaultArg maxEntriesPerNode 10000
    let_comparisonArraySize = defaultArg comparisonArraySize 0
    let_comparisonArrayIsCompleteKey = defaultArg
comparisonArrayIsCompleteKey false
*)
-> BTreeMap
```

VelocityDB Class Library

Parameters

comparer

Type: [VelocityDb.Collection.Comparer.VelocityDbComparer\(Key\)](#)

An object comparer. Try using CompareByField

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

maxEntriesPerNode (Optional)

Type: [System.UInt16](#)

Determines internal array and Page sizes

comparisonArraySize (Optional)

Type: [System.UInt16](#)

Determine how many bytes to reserve for each object within a BTree node as a way to avoid actual object compares.

comparisonArrayIsCompleteKey (Optional)

Type: [System.Boolean](#)

If the comparison array bytes are all that needs to be compared to determine ordering then set this to true; otherwise false

See Also

[BTreeMap\(Key, Value\)Class](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeMap(Key, Value).CopyTo Method

Copies a range of elements from the BTreeBase to a compatible one-dimensional array, starting at the specified index of the target array.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CopyTo(  
    KeyValuePair<Key, Value>[] array,  
    int arrayIndex,  
    int count  
)
```

VB

```
Public Sub CopyTo (  
    array As KeyValuePair(Of Key, Value) (),  
    arrayIndex As Integer,  
    count As Integer  
)
```

C++

```
public:  
void CopyTo (  
    array<KeyValuePair<Key, Value>>^ array,  
    int arrayIndex,  
    int count  
)
```

F#

```
member CopyTo :  
    array : KeyValuePair<'Key, 'Value>[] *  
    arrayIndex : int *  
    count : int -> unit
```

Parameters

array

Type: [System.Collections.Generic.KeyValuePair\(Key, Value\)](#)[]

The one-dimensional Array that is the destination of the elements copied from BTreeBase. The Array must have zero-based indexing.

arrayIndex

Type: [System.Int32](#)

The zero-based index in the array at which copying begins.

count

VelocityDB Class Library

Type: [System.Int32](#)

The number of elements to copy.

C#

```
[SerializableAttribute]  
public abstract class BTreeMapBase<Key, Value> : BTreeBase<Key, Value>, IEnumer-  
able<KeyValuePair<Key, Value>>, IEnumerable, IEnumerable<Key>
```

VB

```
<SerializableAttribute>  
Public MustInherit Class BTreeMapBase(Of Key, Value)  
    Inherits BTreeBase(Of Key, Value)  
    Implements IEnumerable(Of KeyValuePair(Of Key, Value)),  
    IEnumerable, IEnumerable(Of Key)
```

C++

```
[SerializableAttribute]  
generic<typename Key, typename Value>  
public ref class BTreeMapBase abstract : public BTreeBase<Key, Value>, IEnumer-  
able<KeyValuePair<Key, Value>>, IEnumerable, IEnumerable<Key>
```

F#

```
[<AbstractClassAttribute>]  
[<SerializableAttribute>]  
type BTreeMapBase<'Key, 'Value> =  
    class  
        inherit BTreeBase<'Key, 'Value>  
        interface IEnumerable<KeyValuePair<'Key, 'Value>>  
        interface IEnumerable  
        interface IEnumerable<'Key>  
    end
```

*Type Parameters***Key**

The type of key objects in this BTree

Value

The type of value objects in a BTreeMap or BTreeMapOidShort

The BTreeMapBase(Key, Value) type exposes the following members.

Properties

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Item | Given a lookup key, returns the corresponding value within the map or null if not found |
|  TransientBatchSize | Get/Set the max batch size used in API such as AddFast(Key) (Overrides BTreeBase(Key, Value).TransientBatchSize.) |
|  ValuePlacement | Set the value placement to be used for all value objects added to this. This setting is not persisted, it is mainly to be used with objects added with AddFast(Key, Value) |
|  Values | Gets a collection containing the values of this object |

Methods

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AddFast | Adds an element to an array of to be added objects. The objects in this array are added when a call to FlushTransients() is triggered by multiple events such as calling Count and when collection is committed and/or flushed to disk or when the array is full. The array size is by default currently <code>[!:BTreeBase<Key, Value>.transientBatchBufferDefaultSize]</code> but you can get/set the desired size with TransientBatchSize |
|  EnumerateValues | Enumerates all contained Value objects in corresponding key sorted order |
|  FlushTransients | Adds all queued up to be added objects after presorting them transiently (Overrides BTreeBase(Key, Value).FlushTransients().) |
|  GetEnumerator | Enumerates all contained Key objects in sorted order |
|  GetValueId(Key) | When Value type implements IOptimizedPersistable , you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. |
|  GetValueId(Key,Byte[]) | When Value type implements IOptimizedPersistable , you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired. |
|  Iterator | Initializes an iterator to find the keys and values of this map |
|  Last | Returns the last KeyValue object in this set. |

VelocityDB Class Library

| | |
|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
|  LastValue | Returns the last value in this map. |
|  TryGetValue(Key, Value) | Gets the value associated with the specified key. |
|  TryGetValue(Key,Byte[], Value) | Gets the value associated with the specified key. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

BTreeMapBase(Key, Value).Item Property

Given a lookup key, returns the corresponding value within the map or null if not found

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Value this[
    Key key
] { get; set; }
```

VB

```
Public Default Property Item (
    key As Key
) As Value
    Get
    Set
```

C++

```
public:
    virtual property Value default[Key key] {
        Value get (Key key) sealed;
        void set (Key key, Value value) sealed;
    }
```

F#

```
abstract Item : 'Value with get, set
override Item : 'Value with get, set
```

Parameters

key

Type: *Key*

The lookup key

Return Value

Type: *Value*

The value matching the lookup key or null if not found

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void AddFast (  
    Key key,  
    Value value  
)
```

VB

```
Public Sub AddFast (  
    key As Key,  
    value As Value  
)
```

C++

```
public:  
void AddFast (  
    Key key,  
    Value value  
)
```

F#

```
member AddFast :  
    key : 'Key *  
    value : 'Value -> unit
```

Parameters

key

Type: *Key*

The object beeing added

value

Type: *Value*

The associated value added

public:  
unsigned long long GetValueId(  
    Key key  
)
```

F#

```
member GetValueId :  
    key : 'Key -> uint64
```

Parameters

key

Type: *Key*

Lookup object of type *Key* where Value must be implementing [IOptimizedPersistable](#)

Return Value

Type: [UInt64](#)

The Id of the corresponding value object or 0 if not persistent or not implementing [IOptimizedPersistable](#)

When Value type implements [IOptimizedPersistable](#), you can use this function to get the Id of the persistent object instead of the entire object. Use for performance reasons in certain cases where reading the object isn't desired.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong GetValueId(  
    Key key,  
    byte[] comparisonArray  
)
```

VB

```
Public Function GetValueId (  
    key As Key,  
    comparisonArray As Byte()  
) As ULong
```

C++

```
public:  
unsigned long long GetValueId(  
    Key key,  
    array<unsigned char>^ comparisonArray  
)
```

F#

```
member GetValueId :  
    key : 'Key *  
    comparisonArray : byte[] -> uint64
```

Parameters

key

Type: *Key*

Lookup object of type *Key* where Value must be implementing [IOptimizedPersistable](#)

comparisonArray

Type: [System.Byte\[\]](#)

A byte containing bytes to be compared with.

Return Value

Type: [UInt64](#)

The Id of the corresponding value object or 0 if not persistent or not implementing [IOptimizedPersistable](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeMapBase(Key, Value).TryGetValue Method (Key, Value)

Gets the value associated with the specified key.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TryGetValue(  
    Key key,  
    out Value value  
)
```

VB

```
Public Function TryGetValue (  
    key As Key,  
    <OutAttribute> ByRef value As Value  
) As Boolean
```

C++

```
public:  
virtual bool TryGetValue(  
    Key key,  
    [OutAttribute] Value% value  
) sealed
```

F#

```
abstract TryGetValue :  
    key : 'Key *  
    value : 'Value byref -> bool  
override TryGetValue :  
    key : 'Key *  
    value : 'Value byref -> bool
```

Parameters

key

Type: *Key*

The key of the value to get.

value

Type: *Value*

When this method returns, contains the value associated with the specified key, if the key is found; otherwise, the default value for the type of the value parameter. This parameter is passed uninitialized.

Return Value

Type: [Boolean](#)

true if the set contains an element with the specified key; otherwise, false.

VelocityDB Class Library

BTreeMapBase(Key, Value).TryGetValue Method (Key, Byte[], Value)

Gets the value associated with the specified key.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TryGetValue(  
    Key key,  
    byte[] comparisonArray,  
    out Value value  
)
```

VB

```
Public Function TryGetValue (  
    key As Key,  
    comparisonArray As Byte(),  
    <OutAttribute> ByRef value As Value  
) As Boolean
```

C++

```
public:  
bool TryGetValue(  
    Key key,  
    array<unsigned char>^ comparisonArray,  
    [OutAttribute] Value% value  
)
```

F#

```
member TryGetValue :  
    key : 'Key *  
    comparisonArray : byte[] *  
    value : 'Value byref -> bool
```

Parameters

key

Type: *Key*

The key of the value to get.

comparisonArray

Type: [System.Byte\[\]](#)

The comparison array associated with the key to get.

value

Type: *Value*

VelocityDB Class Library

When this method returns, contains the value associated with the specified key, if the key is found; otherwise, the default value for the type of the value parameter. This parameter is passed uninitialized.

Return Value

Type: [Boolean](#)

true if the BTreeBase(Of Key) contains an element with the specified key; otherwise, false.

[System.Object](#)

VelocityDb.Collection.BTree.BTreeMapIterator(Key, Value)

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class BTreeMapIterator<Key, Value>
```

VB

```
Public Class BTreeMapIterator(Of Key, Value)
```

C++

```
generic<typename Key, typename Value>  
public ref class BTreeMapIterator
```

F#

```
type BTreeMapIterator<'Key, 'Value> = class end
```

Type Parameters

Key

The key type of this collection

Value

The value type of this collection

The BTreeMapIterator(Key, Value) type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------|
|  | IndexInTree | Gets the index of the current iterator element in the iterated collection |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|--------------------------------------------------|
|  | Current | The iterator current Key object |
|  | CurrentKey | Returns the Key at the current iterator position |

| | |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
|  CurrentValue | Returns the Value at the current iterator position |
|  GoTo(Key) | Positions iterator at Key object or where Key would be inserted if added to the set. |
|  GoTo(Key,Byte[]) | Positions iterator at Key object or where Key would be inserted if added to the set. This function is normally only used internally by VelocityDb. |
|  GoToLast | Positions iterator at the last object in the set. |
|  MoveNext | Advances the enumerator to the next element of the collection. |
|  MovePrevious | Advances the enumerator to the previous element of the map. |
|  Next | Positions the iterator at the next KeyValuePair in the map. Only use this one with nullable Key type. |
|  Previous | Positions the iterator at the previous Key in the set |
|  ReplaceValue | Replaces a value in map |

BTreeMapIterator(Key, Value).GoTo Method (Key)

Positions iterator at Key object or where Key would be inserted if added to the set.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool GoTo(  
    Key key  
)
```

VB

```
Public Function GoTo (  
    key As Key  
) As Boolean
```

C++

```
public:  
bool GoTo(  
    Key key  
)
```

F#

```
member GoTo :  
    key : 'Key -> bool
```

Parameters

key

Type: *Key*

The object to position iterator near

Return Value

Type: [Boolean](#)

true if an exact match was found; otherwise false

BTreeMapIterator(Key, Value).GoTo Method (Key, Byte[])

Positions iterator at Key object or where Key would be inserted if added to the set. This function is normally only used internally by VelocityDb.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool GoTo(  
    Key key,  
    byte[] comparisonArray  
)
```

VB

```
Public Function GoTo (  
    key As Key,  
    comparisonArray As Byte()  
) As Boolean
```

C++

```
public:  
bool GoTo(  
    Key key,  
    array<unsigned char>^ comparisonArray  
)
```

F#

```
member GoTo :  
    key : 'Key *  
    comparisonArray : byte[] -> bool
```

Parameters

key

Type: *Key*

The object to position iterator near

comparisonArray

Type: [System.Byte\[\]](#)

Contains bytes used for comparing with other arrays for NodeKeys within the set

Return Value

Type: [Boolean](#)

true if an exact match was found; otherwise false

[VelocityDb.Collection.BTree Namespace](#)

BTreeMapIterator(Key, Value).MovePrevious Method

Advances the enumerator to the previous element of the map.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool MovePrevious()
```

VB

```
Public Function MovePrevious As Boolean
```

C++

```
public:  
bool MovePrevious()
```

F#

```
member MovePrevious : unit -> bool
```

Return Value

Type: [Boolean](#)

true if the enumerator was successfully advanced to the previous element; false if the enumerator has reached the position prior to the start of the map.

BTreeMapIterator(Key, Value).Next Method

Positions the iterator at the next KeyValuePair in the map. Only use this one with nullable Key type.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public KeyValuePair<Key, Value> Next ()
```

VB

```
Public Function Next As KeyValuePair(Of Key, Value)
```

C++

```
public:  
KeyValuePair<Key, Value> Next ()
```

F#

```
member Next : unit -> KeyValuePair<'Key, 'Value>
```

Return Value

Type: [KeyValuePair\(Key, Value\)](#)

The next Key or null if we iterated past the the end of the set.

See Also

BTreeMapIterator(Key, Value).Previous Method

Positions the iterator at the previous Key in the set

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public KeyValuePair<Key, Value> Previous()
```

VB

```
Public Function Previous As KeyValuePair(Of Key, Value)
```

C++

```
public:  
KeyValuePair<Key, Value> Previous()
```

F#

```
member Previous : unit -> KeyValuePair<'Key, 'Value>
```

Return Value

Type: [KeyValuePair\(Key, Value\)](#)

The previous Key or null if we iterated to a position before the first Key in the set.

BTreeMapIterator(Key, Value).ReplaceValue Method

Replaces a value in map

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void ReplaceValue(  
    ref Value value  
)
```

VB

```
Public Sub ReplaceValue (  
    ByRef value As Value  
)
```

C++

```
public:  
void ReplaceValue(  
    Value% value  
)
```

F#

```
member ReplaceValue :  
    value : 'Value byref -> unit
```

Parameters

value

Type: *Value*

the value to replace with

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class BTreeMapOidShort<Key, Value> : BTreeMapBase<Key, Value>,
    IEnumerable<KeyValuePair<Key, Value>>, IEnumerable, IEnumerable<Key>
```

VB

```
<SerializableAttribute>
Public Class BTreeMapOidShort (Of Key, Value)
    Inherits BTreeMapBase (Of Key, Value)
    Implements IEnumerable (Of KeyValuePair (Of Key, Value)),
        IEnumerable, IEnumerable (Of Key)
```

C++

```
[SerializableAttribute]
generic<typename Key, typename Value>
public ref class BTreeMapOidShort : public BTreeMapBase<Key, Value>,
    IEnumerable<KeyValuePair<Key, Value>>, IEnumerable, IEnumerable<Key>
```

F#

```
[<SerializableAttribute>]
type BTreeMapOidShort<'Key, 'Value> =
    class
        inherit BTreeMapBase<'Key, 'Value>
        interface IEnumerable<KeyValuePair<'Key, 'Value>>
        interface IEnumerable
        interface IEnumerable<'Key>
    end
```

Type Parameters

Key

The object type of keys in this BTreeMapOidShort/>

Value

The value type of values in this BTreeMapOidShort

The BTreeMapOidShort(Key, Value) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------------------------|--------------------------------|
|  | BTreeMapOidShort(Key, Value) | Creates a new BTreeMapOidShort |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the VelocityDbComparer object that is used to compare Key objects. (Overrides BTreeBase(Key, Value).Comparer.) |
|  | MaxNumberOfDatabases | Allow only a single database for this short id (32bit) references collection (Overrides OptimizedPersistable.MaxNumberOfDatabases.) |
|  | UsesOidShort | Does this BTree use short object references (32 bit) for its internal references? YES it does. (Overrides BTreeBase(Key, Value).UsesOidShort.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------|------------------------------------------------------------------------------------------------|
|  | Clear | Removes all elements from the set. (Overrides BTreeBase(Key, Value).Clear().) |
|  | InitializeAfterRead | (Overrides BTreeBase(Key, Value).InitializeAfterRead(SessionBase).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

BTreeMapOidShort(Key, Value) Constructor

Creates a new BTreeMapOidShort

Namespace: [VelocityDb.Collection.BTree](#)**Assembly:** VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public BTreeMapOidShort (
    VelocityDbComparer<Key> comparer,
    SessionBase session,
    ushort maxEntriesPerNode = 10000,
    ushort comparisonArraySize = 0,
    bool comparisonArrayIsCompleteKey = false
)
```

VB

```
Public Sub New (
    comparer As VelocityDbComparer(Of Key),
    session As SessionBase,
    Optional maxEntriesPerNode As UShort = 10000,
    Optional comparisonArraySize As UShort = 0,
    Optional comparisonArrayIsCompleteKey As Boolean = false
)
```

C++

```
public:
BTreeMapOidShort (
    VelocityDbComparer<Key>^ comparer,
    SessionBase^ session,
    unsigned short maxEntriesPerNode = 10000,
    unsigned short comparisonArraySize = 0,
    bool comparisonArrayIsCompleteKey = false
)
```

F#

```
new :
    comparer : VelocityDbComparer<'Key> *
    session : SessionBase *
    ?maxEntriesPerNode : uint16 *
    ?comparisonArraySize : uint16 *
    ?comparisonArrayIsCompleteKey : bool
(* Defaults:
    let_maxEntriesPerNode = defaultArg maxEntriesPerNode 10000
    let_comparisonArraySize = defaultArg comparisonArraySize 0
    let_comparisonArrayIsCompleteKey = defaultArg
comparisonArrayIsCompleteKey false
*)
-> BTreeMapOidShort
```

VelocityDB Class Library

Parameters

comparer

Type: [VelocityDb.Collection.Comparer.VelocityDbComparer\(Key\)](#)

An object comparer. Try using CompareByField

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

maxEntriesPerNode (Optional)

Type: [System.UInt16](#)

Determines internal array and Page sizes

comparisonArraySize (Optional)

Type: [System.UInt16](#)

Determine how many bytes to reserve for each object within a BTree node as a way to avoid actual object compares.

comparisonArrayIsCompleteKey (Optional)

Type: [System.Boolean](#)

If the comparison array bytes are all that needs to be compared to determine ordering then set this to true; otherwise false

VelocityDb.Collection.BTree.BTreeSet(Key)

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class BTreeSet<Key> : BTreeBase<Key, Key>,
    ISet<Key>, ICollection<Key>, IEnumerable<Key>, IEnumerable
```

VB

```
<SerializableAttribute>
Public Class BTreeSet (Of Key)
    Inherits BTreeBase (Of Key, Key)
    Implements ISet (Of Key), ICollection (Of Key),
    IEnumerable (Of Key), IEnumerable
```

C++

```
[SerializableAttribute]
generic<typename Key>
public ref class BTreeSet : public BTreeBase<Key, Key>,
    ISet<Key>, ICollection<Key>, IEnumerable<Key>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type BTreeSet<'Key> =
    class
        inherit BTreeBase<'Key, 'Key>
        interface ISet<'Key>
        interface ICollection<'Key>
        interface IEnumerable<'Key>
        interface IEnumerable
    end
```

Type Parameters

Key

The key type of objects in this BTree

The BTreeSet(Key) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|------------------------|
|  | BTreeSet(Key) | Creates a new BTreeSet |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the VelocityDbComparer object that is used to compare Key objects. (Overrides BTreeBase(Key, Value).Comparer.) |
|  | UsesOidShort | Does this BTree use short object references (32 bit) for its internal references? NO it does not. (Overrides BTreeBase(Key, Value).UsesOidShort.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  | Clear | Removes all elements from the set. (Overrides BTreeBase(Key, Value).Clear().) |
|  | First | Returns the first Key object in this set. |
|  | InitializeAfterRead | (Overrides BTreeBase(Key, Value).InitializeAfterRead(SessionBase).) |
|  | Iterator | Initializes an iterator to find the keys of this set (Overrides BTreeBase(Key, Value).Iterator().) |
|  | Last | Returns the last Key object in this set. |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

new :
    ?comparer : VelocityDbComparer<'Key> *
    ?session : SessionBase *
    ?maxEntriesPerNode : uint16 *
    ?comparisonArraySize : uint16 *
    ?comparisonArrayIsCompleteKey : bool
(* Defaults:
    let_comparer = defaultArg comparer null
    let_session = defaultArg session null
    let_maxEntriesPerNode = defaultArg maxEntriesPerNode 10000
    let_comparisonArraySize = defaultArg comparisonArraySize 0
    let_comparisonArrayIsCompleteKey = defaultArg
comparisonArrayIsCompleteKey false
```

```
*)  
-> BTreeSet
```

Parameters

comparer (Optional)

Type: [VelocityDb.Collection.Comparer.VelocityDbComparer\(Key\)](#)

An object comparer. Try using CompareByField

session (Optional)

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

maxEntriesPerNode (Optional)

Type: [System.UInt16](#)

Determines internal array and Page sizes

comparisonArraySize (Optional)

Type: [System.UInt16](#)

Determine how many bytes to reserve for each object within a BTree node as a way to avoid actual object compares.

comparisonArrayIsCompleteKey (Optional)

Type: [System.Boolean](#)

If the comparison array bytes are all that needs to be compared to determine ordering then set this to true; otherwise false

[VelocityDb.Collection.BTree Namespace](#)

BTreeSet(Key).Comparer Property

Gets the VelocityDbComparer object that is used to compare Key objects.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override VelocityDbComparer<Key> Comparer { get; }
```

VB

```
Public Overrides ReadOnly Property Comparer As VelocityDbComparer(Of Key)  
    Get
```

C++

```
public:  
virtual property VelocityDbComparer<Key>^ Comparer {  
    VelocityDbComparer<Key>^ get () override;  
}
```

F#

```
abstract Comparer : VelocityDbComparer<'Key> with get  
override Comparer : VelocityDbComparer<'Key> with get
```

Property Value

Type: [VelocityDbComparer\(Key\)](#)

BTreeSet(Key).UsesOidShort Property

Does this BTree use short object references (32 bit) for its internal references? NO it does not.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool UsesOidShort { get; }
```

VB

```
Public Overrides ReadOnly Property UsesOidShort As Boolean  
    Get
```

C++

```
public:  
virtual property bool UsesOidShort {  
    bool get () override;  
}
```

F#

```
abstract UsesOidShort : bool with get  
override UsesOidShort : bool with get
```

Property Value

Type: [Boolean](#)

BTreeSet(Key).BTreeSet(Key) Methods

The [BTreeSet\(Key\)](#) generic type exposes the following members.

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  Clear | Removes all elements from the set. (Overrides BTreeBase(Key, Value).Clear() .) |
|  First | Returns the first Key object in this set. |
|  InitializeAfterRead | (Overrides BTreeBase(Key, Value).InitializeAfterRead(SessionBase) .) |
|  Iterator | Initializes an iterator to find the keys of this set (Overrides BTreeBase(Key, Value).Iterator() .) |
|  Last | Returns the last Key object in this set. |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

BTreeSet(Key).Clear Method

Removes all elements from the set.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Clear ()
```

VB

```
Public Overrides Sub Clear
```

C++

```
public:  
virtual void Clear () override
```

F#

```
abstract Clear : unit -> unit  
override Clear : unit -> unit
```

Implements

[ICollection\(T\).Clear\(\)](#)

See Also

[BTreeSet\(Key\)Class](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeSet(Key).First Method

Returns the first Key object in this set.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Key First()
```

VB

```
Public Function First As Key
```

C++

```
public:  
Key First()
```

F#

```
member First : unit -> 'Key
```

Return Value

Type: *Key*

The first Key in the collection according to the sort order used

VelocityDb.Collection.BTree.BTreeSetIterator(Key)

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class BTreeSetIterator<Key>
```

VB

```
Public Class BTreeSetIterator (Of Key)
```

C++

```
generic<typename Key>  
public ref class BTreeSetIterator
```

F#

```
type BTreeSetIterator<'Key> = class end
```

Type Parameters

Key

The type of the elements contained in the BTreeSet

The BTreeSetIterator(Key) type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------|
|  | IndexInTree | Gets the index of the current iterator element in the iterated collection |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------------------|-------------------------------------------|
|  | Current | The iterator current Key object |
|  | CurrentComparisonArray | The iterator current Key comparison array |
|  | ElementAt | Gets an item at a certain index |

| | |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
|  GoTo(Key) | Positions iterator at Key object or where Key would be inserted if added to the set. |
|  GoTo(Key,Byte[]) | Positions iterator at Key object or where Key would be inserted if added to the set. This function is normally only used internally by VelocityDb. |
|  GoToLast | Positions iterator at the last object in the set. |
|  MoveNext | Advances the enumerator to the next element of the collection. |
|  MovePrevious | Advances the enumerator to the previous element of the collection. |
|  Next | Positions the iterator at the next Key in the set. Only use this one with nullable Key type. |
|  Previous | Positions the iterator at the previous Key in the set |
|  Remove | Not yet ready for public use (testing internally first) |

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool GoTo(  
    Key key  
)
```

VB

```
Public Function GoTo (  
    key As Key  
) As Boolean
```

C++

```
public:  
bool GoTo(  
    Key key  
)
```

F#

```
member GoTo :  
    key : 'Key -> bool
```

Parameters

key

Type: *Key*

The object to position iterator near

Return Value

Type: [Boolean](#)

true if an exact match was found; otherwise false

[BTreeSetIterator\(Key\)Class](#)

[GoTo Overload](#)

[VelocityDb.Collection.BTree Namespace](#)

BTreeSetIterator(Key).GoTo Method (Key, Byte[])

Positions iterator at Key object or where Key would be inserted if added to the set. This function is normally only used internally by VelocityDb.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool GoTo(  
    Key key,  
    byte[] comparisonArray  
)
```

VB

```
Public Function GoTo (  
    key As Key,  
    comparisonArray As Byte()  
) As Boolean
```

C++

```
public:  
bool GoTo(  
    Key key,  
    array<unsigned char>^ comparisonArray  
)
```

F#

```
member GoTo :  
    key : 'Key *  
    comparisonArray : byte[] -> bool
```

Parameters

key

Type: *Key*

The object to position iterator near

comparisonArray

Type: [System.Byte\[\]](#)

Contains bytes used for comparing with other arrays for NodeKeys within the set

Return Value

Type: [Boolean](#)

true if an exact match was found; otherwise false

VelocityDB Class Library

[VelocityDb.OptimizedPersistable](#)

[VelocityDb.Collection.BTree.BTreeNode](#)

[VelocityDb.Collection.BTree.BTreeBase\(Key, Key\)](#)

VelocityDb.Collection.BTree.BTreeSetOidShort(Key)

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class BTreeSetOidShort<Key> : BTreeBase<Key, Key>,
    IEnumerable<Key>, IEnumerable
```

VB

```
<SerializableAttribute>
Public Class BTreeSetOidShort (Of Key)
    Inherits BTreeBase (Of Key, Key)
    Implements IEnumerable (Of Key), IEnumerable
```

C++

```
[SerializableAttribute]
generic<typename Key>
public ref class BTreeSetOidShort : public BTreeBase<Key, Key>,
    IEnumerable<Key>, IEnumerable
```

F#

```
[<SerializableAttribute>]
type BTreeSetOidShort<'Key> =
    class
        inherit BTreeBase<'Key, 'Key>
        interface IEnumerable<'Key>
        interface IEnumerable
    end
```

Type Parameters

Key

The object type of objects in this BTree, currently must be a subclass of [OptimizedPersistable](#)

The BTreeSetOidShort(Key) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------|--------------------------------|
|  | BTreeSetOidShort(Key) | Creates a new BTreeSetOidShort |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Comparer | Gets the VelocityDbComparer object that is used to compare Key objects. (Overrides BTreeBase(Key, Value).Comparer.) |
|  | MaxNumberOfDatabases | Allow only a single database for this short id (32bit) references collection (Overrides OptimizedPersistable.MaxNumberOfDatabases.) |
|  | UsesOidShort | Does this BTree use short object references (32 bit) for its internal references? YES it does. (Overrides BTreeBase(Key, Value).UsesOidShort.) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  | Clear | Removes all elements from the set. (Overrides BTreeBase(Key, Value).Clear().) |
|  | First | Returns the first Key object in this set. |
|  | InitializeAfterRead | (Overrides BTreeBase(Key, Value).InitializeAfterRead(SessionBase).) |
|  | Iterator | Initializes an iterator to find the keys of this set (Overrides BTreeBase(Key, Value).Iterator().) |
|  | Last | Returns the last Key object in this set. |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

BTreeSetOidShort(Key) Constructor

Creates a new BTreeSetOidShort

Namespace: [VelocityDb.Collection.BTree](#)**Assembly:** VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public BTreeSetOidShort (
    VelocityDbComparer<Key> comparer = null,
    SessionBase session = null,
    ushort maxEntriesPerNode = 10000,
    ushort comparisonArraySize = 0,
    bool comparisonArrayIsCompleteKey = false
)
```

VB

```
Public Sub New (
    Optional comparer As VelocityDbComparer(Of Key) = Nothing,
    Optional session As SessionBase = Nothing,
    Optional maxEntriesPerNode As UShort = 10000,
    Optional comparisonArraySize As UShort = 0,
    Optional comparisonArrayIsCompleteKey As Boolean = false
)
```

C++

```
public:
    BTreeSetOidShort (
        VelocityDbComparer<Key>^ comparer = nullptr,
        SessionBase^ session = nullptr,
        unsigned short maxEntriesPerNode = 10000,
        unsigned short comparisonArraySize = 0,
        bool comparisonArrayIsCompleteKey = false
    )
```

F#

```
new :
    ?comparer : VelocityDbComparer<'Key> *
    ?session : SessionBase *
    ?maxEntriesPerNode : uint16 *
    ?comparisonArraySize : uint16 *
    ?comparisonArrayIsCompleteKey : bool
(* Defaults:
    let _comparer = defaultArg comparer null
    let _session = defaultArg session null
    let _maxEntriesPerNode = defaultArg maxEntriesPerNode 10000
    let _comparisonArraySize = defaultArg comparisonArraySize 0
    let _comparisonArrayIsCompleteKey = defaultArg
comparisonArrayIsCompleteKey false
```

```
*)  
-> BTreeSetOidShort
```

Parameters

comparer (Optional)

Type: [VelocityDb.Collection.Comparer.VelocityDbComparer\(Key\)](#)

An object comparer. Try using CompareByField

session (Optional)

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

maxEntriesPerNode (Optional)

Type: [System.UInt16](#)

Determines internal array and Page sizes

comparisonArraySize (Optional)

Type: [System.UInt16](#)

Determine how many bytes to reserve for each object within a BTree node as a way to avoid actual object compares.

comparisonArrayIsCompleteKey (Optional)

Type: [System.Boolean](#)

If the comparison array bytes are all that needs to be compared to determine ordering then set this to true; otherwise false

[VelocityDb.Collection.BTree Namespace](#)

BTreeSetOidShort(Key).Comparer Property

Gets the VelocityDbComparer object that is used to compare Key objects.

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override VelocityDbComparer<Key> Comparer { get; }
```

VB

```
Public Overrides ReadOnly Property Comparer As VelocityDbComparer(Of Key)  
    Get
```

C++

```
public:  
virtual property VelocityDbComparer<Key>^ Comparer {  
    VelocityDbComparer<Key>^ get () override;  
}
```

F#

```
abstract Comparer : VelocityDbComparer<'Key> with get  
override Comparer : VelocityDbComparer<'Key> with get
```

Property Value

Type: [VelocityDbComparer\(Key\)](#)

BTreeSetOidShort(Key).MaxNumberOfDatabases Property

Allow only a single database for this short id (32bit) references collection

Namespace: [VelocityDb.Collection.BTree](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override uint MaxNumberOfDatabases { get; }
```

VB

```
Public Overrides ReadOnly Property MaxNumberOfDatabases As UInteger  
    Get
```

C++

```
public:  
virtual property unsigned int MaxNumberOfDatabases {  
    unsigned int get () override;  
}
```

F#

```
abstract MaxNumberOfDatabases : uint32 with get  
override MaxNumberOfDatabases : uint32 with get
```

Property Value

Type: [UInt32](#)

Implements

[IOptimizedPersistable.MaxNumberOfDatabases](#)

BTreeSetOidShort(Key).BTreeSetOidShort(Key) Methods

The [BTreeSetOidShort\(Key\)](#) generic type exposes the following members.

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  Clear | Removes all elements from the set. (Overrides BTreeBase(Key, Value).Clear() .) |
|  First | Returns the first Key object in this set. |
|  InitializeAfterRead | (Overrides BTreeBase(Key, Value).InitializeAfterRead(SessionBase) .) |
|  Iterator | Initializes an iterator to find the keys of this set (Overrides BTreeBase(Key, Value).Iterator() .) |
|  Last | Returns the last Key object in this set. |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

VelocityDb.Collection.BTree.Extensions Namespace

The `VelocityDb.Collection.BTree.Extensions` namespace contains a few extensions to improve performance of Linq for Objects queries. The same code can also be found in open source as `VelocityDBExtensions.Extensions.BTree`

Classes

| | Class | Description |
|-----------------------------------------------------------------------------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|  | BTreeExtensions | A few extensions to improve performance of Linq for Objects queries We need your HELP to improve it to cover more use cases of queries! |

BTreeExtensions Class

A few extensions to improve performance of Linq for Objects queries We need your HELP to improve it to cover more use cases of queries!

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Collection.BTree.Extensions.BTreeExtensions

Namespace: [VelocityDb.Collection.BTree.Extensions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static class BTreeExtensions
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class BTreeExtensions
```

C++

```
[ExtensionAttribute]  
public ref class BTreeExtensions abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type BTreeExtensions = class end
```

The **BTreeExtensions** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|-----------------------------------------------------------------|
|  | Count(Key) | Override to improve performance over IEnumerable LINQ extension |
|  | Where(Key) | Override to improve performance over IEnumerable LINQ extension |

See Also

[VelocityDb.Collection.BTree.Extensions Namespace](#)

BTreeExtensions.BTreeExtensions Methods

The [BTreeExtensions](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|-----------------------------------------------------------------|
|  | Count(Key) | Override to improve performance over IEnumerable LINQ extension |
|  | Where(Key) | Override to improve performance over IEnumerable LINQ extension |

[BTreeExtensions Class](#)

[VelocityDb.Collection.BTree.Extensions Namespace](#)

BTreeExtensions.Count(Key) Method

Override to improve performance over IEnumerable LINQ extension

Namespace: [VelocityDb.Collection.BTree.Extensions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static int Count<Key>(
    this BTreeBase<Key, Key> sourceCollection
)
```

VB

```
<ExtensionAttribute>
Public Shared Function Count(Of Key) (
    sourceCollection As BTreeBase(Of Key, Key)
) As Integer
```

C++

```
public:
[ExtensionAttribute]
generic<typename Key>
static int Count(
    BTreeBase<Key, Key>^ sourceCollection
)
```

F#

```
[<ExtensionAttribute>]
static member Count :
    sourceCollection : BTreeBase<'Key, 'Key> -> int
```

Parameters

sourceCollection

Type: [VelocityDb.Collection.BTree.BTreeBase\(Key, Key\)](#)

the collection

Type Parameters

Key

key type

Return Value

Type: [Int32](#)

Size of the collection

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [BTreeBase](#)(**Key**, **Key**). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[BTreeExtensions Class](#)

[VelocityDb.Collection.BTree.Extensions Namespace](#)

BTreeExtensions.Where(Key) Method

Override to improve performance over IEnumerable LINQ extension

Namespace: [VelocityDb.Collection.BTree.Extensions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IEnumerable<Key> Where<Key>(
    this BTreeBase<Key, Key> sourceCollection,
    Expression<Func<Key, bool>> expr
)
```

VB

```
<ExtensionAttribute>
Public Shared Function Where(Of Key) (
    sourceCollection As BTreeBase(Of Key, Key),
    expr As Expression(Of Func(Of Key, Boolean))
) As IEnumerable(Of Key)
```

C++

```
public:
[ExtensionAttribute]
generic<typename Key>
static IEnumerable<Key>^ Where(
    BTreeBase<Key, Key>^ sourceCollection,
    Expression<Func<Key, bool>^>^ expr
)
```

F#

```
[<ExtensionAttribute>]
static member Where :
    sourceCollection : BTreeBase<'Key, 'Key> *
    expr : Expression<Func<'Key, bool>> -> IEnumerable<'Key>
```

Parameters

sourceCollection

Type: [VelocityDb.Collection.BTree.BTreeBase\(Key, Key\)](#)

the collection

expr

Type: [System.Linq.Expressions.Expression\(Func\(Key, Boolean\)\)](#)

an expression

Type Parameters

Key

key type

Return Value

Type: [IEnumerable](#)(**Key**)

Enumeration of collection where the expression evaluates to true

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [BTreeBase](#)(**Key, Key**). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[BTreeExtensions Class](#)

[VelocityDb.Collection.BTree.Extensions Namespace](#)

VelocityDb.Collection.Comparer Namespace

The `VelocityDb.Collection.Comparer` namespace contains classes for the VelocityDb Comparer classes optimized for persistent storage in VelocityDb databases

Classes

| Class | Description |
|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ByteArrayComparer | Compares two byte arrays |
|  CompareByField(Key) | Use this predefined comparator whenever the sorting can be defined by specifying one or more fields of the sorted Key type. |
|  CompareByFieldIndex(Key) | Internal use for Index implementation |
|  HashCodeComparer(T) | When the type of object being compared is a simple type like a string and you don't care about the sort order, then this comparator is what you want to use. It is similar to using a hash based collection but with less overhead (more compact) This kind of comparator especially shines when you create the BTreeSet/BTreeMap using a comparisonByteArray size of 4 |
|  SimpleComparer(T) | When the type of object being compared is a simple type like string, int, ..., this is the comparator you probably want to use. |
|  VelocityDbComparer(Key) | The base class of for comparing persistent objects. If the Key objects implements IComparable then the NodeKeys are compared that way, otherwise the Id are compared |

ByteArrayComparer Class

Compares two byte arrays

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Collection.Comparer.ByteArrayComparer

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class ByteArrayComparer : IComparer<byte[]>
```

VB

```
<SerializableAttribute>
Public Class ByteArrayComparer
    Implements IComparer(Of Byte())
```

C++

```
[SerializableAttribute]
public ref class ByteArrayComparer : IComparer<array<unsigned char>^>
```

F#

```
[<SerializableAttribute>]
type ByteArrayComparer =
    class
        interface IComparer<byte[]>
    end
```

The **ByteArrayComparer** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------|------------------------------------------------------------------|
|  | ByteArrayComparer | Initializes a new instance of the ByteArrayComparer class |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|-------------|
|  | Compare | |
|  | memcmp | |

VelocityDB Class Library

[VelocityDb.Collection.Comparer.VelocityDbComparer\(Key\)](#)

VelocityDb.Collection.Comparer.CompareByField(Key)

[VelocityDb.Collection.Comparer.CompareByFieldIndex\(Key\)](#)

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class CompareByField<Key> : VelocityDbComparer<Key>
```

VB

```
<SerializableAttribute>  
Public Class CompareByField(Of Key)  
    Inherits VelocityDbComparer(Of Key)
```

C++

```
[SerializableAttribute]  
generic<typename Key>  
public ref class CompareByField : public VelocityDbComparer<Key>
```

F#

```
[<SerializableAttribute>]  
type CompareByField<'Key> =  
    class  
        inherit VelocityDbComparer<'Key>  
    end
```

Type Parameters

Key

The type of object being compared (containing field(s) to compare)

The CompareByField(Key) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | CompareByField(Key)(SessionBase) | This special constructor is provided so that VelocityDb can instantiate the object after reading it from disk. This is also the place to initialize transient variables of the object. |
|  | CompareByField(Key)(String, SessionBase, Boolean, Boolean, Boolean) | Compares objects by comparing one or more data fields of type Key |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AddOidCompare | Is the object Oid going to be compared when all the compared fields are equal? (Overrides VelocityDbComparer(Key).AddOidCompare.) |
|  | FieldsToCompare | |
|  | OidPartOfComparisonBytes | Is the Oid (or OidShort) included in the comparison array bytes? (Overrides VelocityDbComparer(Key).OidPartOfComparisonBytes.) |

Methods

| | Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AddFieldToCompare | Add an additional field to compare when prior fields all are equal |
|  | Compare(Key, Key) | Compares field(s) of Key a with field(s) of Key b (Overrides VelocityDbComparer(Key).Compare(Key, Key).) |
|  | Compare(Byte[], Int32, Byte[], Key) | (Overrides VelocityDbComparer(Key).Compare(Byte[], Int32, Byte[], Key).) |
|  | CompareField | For internal use. Compares a field value in two objects |
|   | GetHashCode32 | Microsoft messed up the 64 bit version of GetHashCode. Use this original 32-bit version to get consistent String hash codes across 32 bit and 64 bit builds. See remarks in https://msdn.microsoft.com/en-us/library/system.string.gethashcode(v=vs.110).aspx |
|  | InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase).) |
|  | SetComparisonArrayFromObject | Sets a byte array equivalent to the field values to compare. Using this bypasses object compares, instead the byte arrays are compared byte by byte until a diff is found. If a byte diff isn't found then object compares may happen. Field types currently supported: byte, bool, Char, string, Int16, Int32, Int64, UInt16, UInt32, UInt64, Single, Double, DateTime, TimeSpan (Overrides |

| | | |
|-----------------------------------------------------------------------------------|--------------------------------------|---------------------------------------------------------------------------------------------|
| | | VelocityDbComparer(Key).SetComparisonArrayFromObject(Key,Byte[], Boolean).) |
|  | SetupFieldsToCompare | Initializes data used to compare fields as specified with this comparer. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

CompareByField(Key) Constructor (SessionBase)

This special constructor is provided so that VelocityDb can instantiate the object after reading it from disk. This is also the place to initialize transient variables of the object.

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public CompareByField(  
    SessionBase session  
)
```

VB

```
Public Sub New (  
    session As SessionBase  
)
```

C++

```
public:  
CompareByField(  
    SessionBase^ session  
)
```

F#

```
new :  
    session : SessionBase -> CompareByField
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object.

[VelocityDb.Collection.Comparer Namespace](#)

CompareByField(Key) Constructor (String, SessionBase, Boolean, Boolean, Boolean)

Compares objects by comparing one or more data fields of type Key

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public CompareByField(  
    string field,  
    SessionBase session,  
    bool doIdCompareIfEqual = false,  
    bool sortStringsByHashCode = false,  
    bool ascendingSort = true  
)
```

VB

```
Public Sub New (  
    field As String,  
    session As SessionBase,  
    Optional doIdCompareIfEqual As Boolean = false,  
    Optional sortStringsByHashCode As Boolean = false,  
    Optional ascendingSort As Boolean = true  
)
```

C++

```
public:  
CompareByField(  
    String^ field,  
    SessionBase^ session,  
    bool doIdCompareIfEqual = false,  
    bool sortStringsByHashCode = false,  
    bool ascendingSort = true  
)
```

F#

```
new :  
    field : string *  
    session : SessionBase *  
    ?doIdCompareIfEqual : bool *  
    ?sortStringsByHashCode : bool *  
    ?ascendingSort : bool  
(* Defaults:  
    let _doIdCompareIfEqual = defaultArg doIdCompareIfEqual false  
    let _sortStringsByHashCode = defaultArg sortStringsByHashCode false  
    let _ascendingSort = defaultArg ascendingSort true  
)  
-> CompareByField
```

Parameters

field

Type: [System.String](#)

Primary field to use for comparison.

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

doldCompareIfEqual (Optional)

Type: [System.Boolean](#)

Optionally compare Oid's when fields are equal between compared objects

sortStringsByHashCode (Optional)

Type: [System.Boolean](#)

Sort string fields by hash code first then secondly as normal string compare

ascendingSort (Optional)

Type: [System.Boolean](#)

If `true` (`True` in Visual Basic) (default), sort in ascending order, otherwise in descending order

CompareByField(Key).AddOidCompare Property

Is the object Oid going to be compared when all the compared fields are equal?

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool AddOidCompare { get; }
```

VB

```
Public Overrides ReadOnly Property AddOidCompare As Boolean  
    Get
```

C++

```
public:  
virtual property bool AddOidCompare {  
    bool get () override;  
}
```

F#

```
abstract AddOidCompare : bool with get  
override AddOidCompare : bool with get
```

Property Value

Type: [Boolean](#)

CompareByField(Key).CompareByField(Key) Methods

The [CompareByField\(Key\)](#) generic type exposes the following members.

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AddFieldToCompare | Add an additional field to compare when prior fields all are equal |
|  Compare(Key, Key) | Compares field(s) of Key a with field(s) of Key b (Overrides VelocityDbComparer(Key).Compare(Key, Key) .) |
|  Compare(Byte[], Int32,Byte[], Key) | (Overrides VelocityDbComparer(Key).Compare(Byte[], Int32,Byte[], Key) .) |
|  CompareField | For internal use. Compares a field value in two objects |
|  GetHashCode32  | Microsoft messed up the 64 bit version of GetHashCode. Use this original 32-bit version to get consistent String hash codes across 32 bit and 64 bit builds. See remarks in https://msdn.microsoft.com/en-us/library/system.string.gethashcode(v=vs.110).aspx |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase) .) |
|  SetComparisonArrayFromObject | Sets a byte array equivalent to the field values to compare. Using this bypasses object compares, instead the byte arrays are compared byte by byte until a diff is found. If a byte diff isn't found then object compares may happen. Field types currently supported: byte, bool, Char, string, Int16, Int32, Int64, UInt16, UInt32, UInt64, Single, Double, DateTime, TimeSpan (Overrides VelocityDbComparer(Key).SetComparisonArrayFromObject(Key,Byte[], Boolean) .) |
|  SetupFieldsToCompare | Initializes data used to compare fields as specified with this comparer. |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

CompareByField(Key).AddFieldToCompare Method

Add an additional field to compare when prior fields all are equal

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void AddFieldToCompare (  
    string field,  
    bool ascendingSort = true  
)
```

VB

```
Public Sub AddFieldToCompare (  
    field As String,  
    Optional ascendingSort As Boolean = true  
)
```

C++

```
public:  
void AddFieldToCompare (  
    String^ field,  
    bool ascendingSort = true  
)
```

F#

```
member AddFieldToCompare :  
    field : string *  
    ?ascendingSort : bool  
(* Defaults:  
    let_ascendingSort = defaultArg ascendingSort true  
)  
-> unit
```

Parameters

field

Type: [System.String](#)

Field name of field to compare

ascendingSort (Optional)

Type: [System.Boolean](#)

If `true` (`True` in Visual Basic) (default), sort in ascending order, otherwise in descending order

```

F#

```
abstract Compare :  
    a : 'Key *  
    b : 'Key -> int  
override Compare :  
    a : 'Key *  
    b : 'Key -> int
```

Parameters

a

Type: *Key*
the first object

b

Type: *Key*
the second object

Return Value

Type: [Int32](#)

-1 if a less than b, 0 if equal and 1 if a greater than b

CompareByField(Key).CompareField Method

For internal use. Compares a field value in two objects

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int CompareField(  
    DataMember member,  
    Object a,  
    Object b,  
    int fieldIndex  
)
```

VB

```
Public Function CompareField (  
    member As DataMember,  
    a As Object,  
    b As Object,  
    fieldIndex As Integer  
) As Integer
```

C++

```
public:  
int CompareField(  
    DataMember^ member,  
    Object^ a,  
    Object^ b,  
    int fieldIndex  
)
```

F#

```
member CompareField :  
    member : DataMember *  
    a : Object *  
    b : Object *  
    fieldIndex : int -> int
```

Parameters

member

Type: [VelocityDb.TypeInfo.DataMember](#)

Field meta data

a

Type: [System.Object](#)

First object

b

Type: [System.Object](#)

Second object

fieldIndex

Type: [System.Int32](#)

indicates which of the fields in this comparer

Return Value

Type: [Int32](#)

A 32-bit signed integer that indicates whether this instance precedes, follows, or appears in the same position in the sort order as the value parameter.

CompareByField(Key).GetHashCode32 Method

Microsoft messed up the 64 bit version of GetHashCode. Use this original 32-bit version to get consistent [String](#) hash codes across 32 bit and 64 bit builds. See remarks in [https://msdn.microsoft.com/en-us/library/system.string.gethashcode\(v=vs.110\).aspx](https://msdn.microsoft.com/en-us/library/system.string.gethashcode(v=vs.110).aspx)

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static int GetHashCode32 (  
    string s  
)
```

VB

```
Public Shared Function GetHashCode32 (  
    s As String  
) As Integer
```

C++

```
public:  
static int GetHashCode32 (  
    String^ s  
)
```

F#

```
static member GetHashCode32 :  
    s : string -> int
```

Parameters

s

Type: [System.String](#)

[String](#)

to compute hash code for.

Return Value

Type: [Int32](#)

A 32-bit hash code

CompareByField(Key).InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRecreate(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRecreate(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit  
override InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRecreate\(SessionBase\)](#)

CompareByField(Key).SetComparisonArrayFromObject Method

Sets a byte array equivalent to the field values to compare. Using this bypasses object compares, instead the byte arrays are compared byte by byte until a diff is found. If a byte diff isn't found then object compares may happen. Field types currently supported: byte, bool, Char, string, Int16, Int32, Int64, UInt16, UInt32, UInt64, Single, Double, DateTime, TimeSpan

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void SetComparisonArrayFromObject (
    Key key,
    byte[] comparisonArray,
    bool oidShort
)
```

VB

```
Public Overrides Sub SetComparisonArrayFromObject (
    key As Key,
    comparisonArray As Byte(),
    oidShort As Boolean
)
```

C++

```
public:
virtual void SetComparisonArrayFromObject (
    Key key,
    array<unsigned char>^ comparisonArray,
    bool oidShort
) override
```

F#

```
abstract SetComparisonArrayFromObject :
    key : 'Key *
    comparisonArray : byte[] *
    oidShort : bool -> unit
override SetComparisonArrayFromObject :
    key : 'Key *
    comparisonArray : byte[] *
    oidShort : bool -> unit
```

Parameters

key

Type: *Key*

A key from which to extract a comparison byte array based on field(s) to compare

comparisonArray

VelocityDB Class Library

Type: [System.Byte\[\]](#)

The array to set bytes of

oidShort

Type: [System.Boolean](#)

If *oidShort* is true then only the page and slot numbers need to be compared if the comparator bytes includes any Oid bytes

```

Type Parameters

Key

[Missing <typeparam name="Key"/> documentation for "T:VelocityDb.Collection.Comparer.CompareByFieldIndex`1"]

The CompareByFieldIndex(Key) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------------------|------------------------------------------------------------------|
|  | CompareByFieldIndex(Key) | Initializes a new instance of the CompareByFieldIndex(Key) class |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Compare | Compares field(s) of Key a with field(s) of Key b (Overrides CompareByField(Key).Compare(Key, Key).) |
|  | InitNew | Internal Use |
|  | SetupFieldsToCompare | Initializes data used to compare fields as specified with this comparer. (Overrides CompareByField(Key).SetupFieldsToCompare().) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

CompareByFieldIndex(Key).SetupFieldsToCompare Method

Initializes data used to compare fields as specified with this comparer.

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void SetupFieldsToCompare ()
```

VB

```
Public Overrides Sub SetupFieldsToCompare
```

C++

```
public:  
virtual void SetupFieldsToCompare () override
```

F#

```
abstract SetupFieldsToCompare : unit -> unit  
override SetupFieldsToCompare : unit -> unit
```

HashCodeComparer(T) Class

When the type of object being compared is a simple type like a string and you don't care about the sort order, then this comparator is what you want to use. It is similar to using a hash based collection but with less overhead (more compact) This kind of comparator especially shines when you create the BTreeSet/BTreeMap using a comparisonByteArray size of 4

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

[VelocityDb.Collection.Comparer.VelocityDbComparer\(T\)](#)

VelocityDb.Collection.Comparer.HashCodeComparer(T)

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class HashCodeComparer<T> : VelocityDbComparer<T>  
where T : IComparable
```

VB

```
<SerializableAttribute>  
Public Class HashCodeComparer (Of T As IComparable)  
    Inherits VelocityDbComparer (Of T)
```

C++

```
[SerializableAttribute]  
generic<typename T>  
where T : IComparable  
public ref class HashCodeComparer : public VelocityDbComparer<T>
```

F#

```
[<SerializableAttribute>]  
type HashCodeComparer<'T when 'T : IComparable> =  
    class  
        inherit VelocityDbComparer<'T>  
    end
```

Type Parameters

T

The type of object to compare which must implement [IComparable](#)

The HashCodeComparer(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------|-------------------------------------------------------------|
|  | HashCodeComparer(T) | Initializes a new instance of the HashCodeComparer(T) class |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Compare | If the Key objects implements IComparable then the NodeKeys are compared that way, otherwise the Id are compared (Overrides VelocityDbComparer(Key).Compare(Key, Key).) |
|  | SetComparisonArrayFromObject | Comparators that use comparison arrays need to override this function. Given a Key object, set the comparisonArray bytes (Overrides VelocityDbComparer(Key).SetComparisonArrayFromObject(Key, Byte[], Boolean).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

HashCodeComparer(*T*).Compare Method

If the Key objects implements [IComparable](#) then the NodeKeys are compared that way, otherwise the [Id](#) are compared

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override int Compare(  
    T a,  
    T b  
)
```

VB

```
Public Overrides Function Compare (  
    a As T,  
    b As T  
) As Integer
```

C++

```
public:  
virtual int Compare(  
    T a,  
    T b  
) override
```

F#

```
abstract Compare :  
    a : 'T *  
    b : 'T -> int  
override Compare :  
    a : 'T *  
    b : 'T -> int
```

Parameters

a

Type: *T*

object a to compare

b

Type: *T*

object b to compare with

Return Value

Type: [Int32](#)

-1 if a less than b, 0 if == and 1 if a is greater than b

VelocityDB Class Library

Implements

[IComparer\(T\).Compare\(T, T\)](#)

HashCodeComparer(T).SetComparisonArrayFromObject Method

Comparators that use comparison arrays need to override this function. Given a Key object, set the comparisonArray bytes

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void SetComparisonArrayFromObject (
    T key,
    byte[] comparisonArray,
    bool oidShort
)
```

VB

```
Public Overrides Sub SetComparisonArrayFromObject (
    key As T,
    comparisonArray As Byte(),
    oidShort As Boolean
)
```

C++

```
public:
virtual void SetComparisonArrayFromObject (
    T key,
    array<unsigned char>^ comparisonArray,
    bool oidShort
) override
```

F#

```
abstract SetComparisonArrayFromObject :
    key : 'T *
    comparisonArray : byte[] *
    oidShort : bool -> unit
override SetComparisonArrayFromObject :
    key : 'T *
    comparisonArray : byte[] *
    oidShort : bool -> unit
```

Parameters

key

Type: *T*

The object from which to extract the comparison array bytes

comparisonArray

Type: [System.Byte\[\]](#)

The array containing the object comparison bytes

VelocityDB Class Library

oidShort

Type: [System.Boolean](#)

If `oidShort` is true then only the page and slot numbers need to be compared if the comparator bytes includes any Oid bytes

```
[<SerializableAttribute>]  
type SimpleComparer<'T when 'T : IComparable> =  
    class  
        inherit VelocityDbComparer<'T>  
    end
```

Type Parameters

T

The type of object to compare which must implement [IComparable](#)

The SimpleComparer(T) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------|-----------------------------------------------------------|
|  | SimpleComparer(T) | Initializes a new instance of the SimpleComparer(T) class |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Compare | If the Key objects implements IComparable then the NodeKeys are compared that way, otherwise the Id are compared (Overrides VelocityDbComparer(Key).Compare(Key, Key).) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

[<SerializableAttribute>]  
type VelocityDbComparer<'Key> =  
    class  
        inherit OptimizedPersistable  
        interface IComparer<'Key>  
    end
```

Type Parameters

Key

The type of keys to compare

The VelocityDbComparer(Key) type exposes the following members.

Constructors

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
|  VelocityDbComparer(Key) | Initializes a new instance of the VelocityDbComparer(Key) class |

Properties

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
|  AddOidCompare | The default compare compares the object Oid's but subclasses may not want to do so as a last compare before declaring objects as being equal. |
|  OidPartOfComparisonBytes | Is the Oid part of the comparison bytes? If so, we don't need to do a separate Oid compare when Oid is part of compare |

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|  Compare(Key, Key) | If the Key objects implements IComparable then the NodeKeys are compared that way, otherwise the Id are compared |
|  Compare(Byte[], Int32,Byte[], Key) | Internal use, compares comparison array bytes |
|  SetComparisonArrayFromObject | Comparators that use comparison arrays need to override this function. Given a Key object, set the comparisonArray bytes |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

VelocityDbComparer(Key).Compare Method (Byte[], Int32, Byte[], Key)

Internal use, compares comparison array bytes

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual int Compare(  
    byte[] nodeComparisonArray,  
    int index,  
    byte[] comparisonArray,  
    Key key  
)
```

VB

```
Public Overridable Function Compare (  
    nodeComparisonArray As Byte(),  
    index As Integer,  
    comparisonArray As Byte(),  
    key As Key  
) As Integer
```

C++

```
public:  
virtual int Compare(  
    array<unsigned char>^ nodeComparisonArray,  
    int index,  
    array<unsigned char>^ comparisonArray,  
    Key key  
)
```

F#

```
abstract Compare :  
    nodeComparisonArray : byte[] *  
    index : int *  
    comparisonArray : byte[] *  
    key : 'Key -> int  
override Compare :  
    nodeComparisonArray : byte[] *  
    index : int *  
    comparisonArray : byte[] *  
    key : 'Key -> int
```

Parameters

nodeComparisonArray

Type: [System.Byte\[\]](#)

BTree node array of [Byte](#) for all current objects in node

VelocityDB Class Library

index

Type: [System.Int32](#)

Object index in node to compare with

comparisonArray

Type: [System.Byte\[\]](#)

Bytes to compare with

key

Type: *Key*

Object compared with

Return Value

Type: [Int32](#)

-1 if this node bytes is less than comparisonArray bytes, 0 if equal, otherwise 1

VelocityDbComparer(Key).SetComparisonArrayFromObject Method

Comparators that use comparison arrays need to override this function. Given a Key object, set the comparisonArray bytes

Namespace: [VelocityDb.Collection.Comparer](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void SetComparisonArrayFromObject (
    Key key,
    byte[] comparisonArray,
    bool oidShort
)
```

VB

```
Public Overridable Sub SetComparisonArrayFromObject (
    key As Key,
    comparisonArray As Byte(),
    oidShort As Boolean
)
```

C++

```
public:
virtual void SetComparisonArrayFromObject (
    Key key,
    array<unsigned char>^ comparisonArray,
    bool oidShort
)
```

F#

```
abstract SetComparisonArrayFromObject :
    key : 'Key *
    comparisonArray : byte[] *
    oidShort : bool -> unit
override SetComparisonArrayFromObject :
    key : 'Key *
    comparisonArray : byte[] *
    oidShort : bool -> unit
```

Parameters

key

Type: *Key*

The object from which to extract the comparison array bytes

comparisonArray

Type: [System.Byte\[\]](#)

The array containing the object comparison bytes

VelocityDB Class Library

oidShort

Type: [System.Boolean](#)

If *oidShort* is true then only the page and slot numbers need to be compared if the comparator bytes includes any Oid bytes

VelocityDb.Exceptions Namespace

The `VelocityDb.Session` namespace contains all exceptions that may be thrown by VelocityDB code.

Classes

| Class | Description |
|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
|  AlreadyInCommitException | Exception thrown when attempting to commit a transaction when we already are within transaction commit code. |
|  AlreadyInTransactionException | Exception thrown when attempting to start a transaction when an active transaction already exist. |
|  DatabaseAlreadyExistsException | Exception thrown when trying to create a Database that already exist (file system file exist). |
|  DatabaseDoesNotExistException | Exception thrown when the requested Database does not exist. |
|  DatabaseReadLockException | Exception thrown when a Database level read lock failed. |
|  DesKeyMissingException | Exception thrown when an internal error was detected. This type of error is most likly due to a bug in VelocityDb. |
|  FieldDoesNotExistException | Exception thrown when specifying a field name that does not exist in the given class/struct. |
|  IndexDatabaseNotSpecifiedException | Exception thrown when attempting to open an in database index without specifying a database. |
|  IndexDatabaseOrBTreeMissingException | Exception thrown when attempting to open an in database index without specifying a database. |

| | | |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | IndexDatabaseSpecifiedForGlobalIndexException | <p>Exception thrown when attempting to open a global index and specifying a database.</p> |
|  | InternalErrorException | <p>Exception thrown when an internal error was detected. This type of error is most likely due to a bug in VelocityDb.</p> |
|  | InTransactionException | <p>Exception thrown when calling certain SessionBase api that requires that session IS NOT in an active transaction.</p> |
|  | InUpdateTransactionException | <p>Exception thrown when calling certain SessionBase api that requires that session IS NOT in an active update transaction.</p> |
|  | InvalidChangeOfDatabaseLocation | <p>Exception thrown when trying to do an invalid change of a DatabaseLocation. It could be a change to the start database number that if permitted skips one or more other DatabaseLocations.</p> |
|  | InvalidChangeOfDefaultLocationException | <p>Exception thrown when trying to do an invalid change of the startup DatabaseLocation.</p> |
|  | MaxNumberOfDatabasesException | <p>Exception thrown when trying to create a Database but no more Database numbers are available. The Maximum Database number is MaxValue or 13 if no valid license is found.</p> |
|  | NotInTransactionException | <p>Exception thrown when trying to do persistent operations without first starting a transaction.</p> |

| | |
|--------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
|  NoValidVelocityDBLicenseFoundException | Exception thrown when trying to add/update database schema and no valid VelocityDB license is found in license database (4.odt). |
|  NullObjectException | Exception thrown when an object unexpectedly is null. |
|  ObjectDoesNotExistException | Exception thrown when the requested >IOptimizedPersistable does not exist. |
|  ObjectNotInSameDatabaseAsOidShortCollectionException | Exception thrown when object is not in the same database as a ShortOid collection Database failed. |
|  OpenDatabaseException | Exception thrown when opening a Database failed. |
|  OptimisticLockingFailed | Exception thrown when a optimistic locking failed due to another transaction having updated a Page or Database. |
|  PageDeadLockException | Exception thrown when a Page level lock failed due to a deadlock with another transaction |
|  PageDoesNotExistException | Exception thrown when the requested >Page does not exist. |
|  PageReadLockException | Exception thrown when failing to get a Page level read lock. |
|  PageUpdateLockException | Exception thrown when a Page level update lock failed. |
|  PersistedObjectExpectedException | Exception thrown when a persisted object was expected but was not. |

| | | |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
|  | ReferentialIntegrityException | Exception thrown when an internal error was detected. This type of error is most likely due to a bug in VelocityDb. |
|  | RequestedPlacementDatabaseNumberNotValidException | Exception thrown when a requested placement Database number is invalid. |
|  | RequestedPlacementPageNumberNotValidException | Exception thrown when a requested placement Page number is invalid. |
|  | SubscriptionsNotAvailableWithNoServerSessionException | Exception thrown when trying to use event subscription api with NON server session. Subscriptions require use of server. |
|  | SystemDatabaseNotFoundWithReadOnlyTransactionException | Exception thrown when a read only transaction try to open a non existing Database 0 |
|  | TryingToBeginReadOnlyTransactionWhileInUpdateTransactionException | Exception thrown when attempting to start a read only transaction while in an update transaction. |
|  | TryingToDeleteDeletedDatabaseException | Exception thrown when attempting to delete a Database that already was deleted in the same transaction |
|  | UnexpectedException | Exception thrown when something unexpected happened and no specific exception exist for it. |
|  | UniqueConstraintException | Exception thrown when attempting to open an in database index without specifying a database. |
|  | UpdateLockFailedException | Exception thrown when an update lock failed. |
|  | WeakIOptimizedPersistableReferenceMustBePersistentException | Exception thrown when a persisted object was expected but was not. |

AlreadyInCommitException Class

Exception thrown when attempting to commit a transaction when we already are within transaction commit code.

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

VelocityDb.Exceptions.AlreadyInCommitException

Namespace: [VelocityDb.Exceptions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class AlreadyInCommitException : Exception
```

VB

```
<SerializableAttribute>  
Public Class AlreadyInCommitException  
    Inherits Exception
```

C++

```
[SerializableAttribute]  
public ref class AlreadyInCommitException : public Exception
```

F#

```
[<SerializableAttribute>]  
type AlreadyInCommitException =  
    class  
        inherit Exception  
    end
```

See Also

AlreadyInTransactionException Class

Exception thrown when attempting to start a transaction when an active transaction already exist.

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

VelocityDb.Exceptions.AlreadyInTransactionException

Namespace: [VelocityDb.Exceptions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class AlreadyInTransactionException : Exception
```

VB

```
<SerializableAttribute>  
Public Class AlreadyInTransactionException  
    Inherits Exception
```

C++

```
[SerializableAttribute]  
public ref class AlreadyInTransactionException : public Exception
```

F#

```
[<SerializableAttribute>]  
type AlreadyInTransactionException =  
    class  
        inherit Exception  
    end
```

DatabaseAlreadyExistsException Class

Exception thrown when trying to create a [Database](#) that already exist (file system file exist).

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

VelocityDb.Exceptions.DatabaseAlreadyExistsException

Namespace: [VelocityDb.Exceptions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#
[SerializableAttribute]
public class DatabaseAlreadyExistsException : Exception
```

```
VB
<SerializableAttribute>
Public Class DatabaseAlreadyExistsException
    Inherits Exception
```

```
C++
[SerializableAttribute]
public ref class DatabaseAlreadyExistsException : public Exception
```

```
F#
[<SerializableAttribute>]
type DatabaseAlreadyExistsException =
    class
        inherit Exception
    end
```

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
|  | DatabaseAlreadyExistsException() | Initializes a new instance of the DatabaseAlreadyExistsException class |
|  | DatabaseAlreadyExistsException(String) | Initializes a new instance of the DatabaseAlreadyExistsException class |
|  | DatabaseAlreadyExistsException(SerializationInfo, StreamingContext) | Initializes a new instance of the DatabaseAlreadyExistsException class |
|  | DatabaseAlreadyExistsException(String, Exception) | Initializes a new instance of the DatabaseAlreadyExistsException class |

OptimisticLockingFailed Class

Exception thrown when an optimistic locking failed due to another transaction having updated a Page or Database.

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

VelocityDb.Exceptions.OptimisticLockingFailed

Namespace: [VelocityDb.Exceptions](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class OptimisticLockingFailed : Exception
```

VB

```
<SerializableAttribute>  
Public Class OptimisticLockingFailed  
    Inherits Exception
```

C++

```
[SerializableAttribute]  
public ref class OptimisticLockingFailed : public Exception
```

F#

```
[<SerializableAttribute>]  
type OptimisticLockingFailed =  
    class  
        inherit Exception  
    end
```

The **OptimisticLockingFailed** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------|------------------------------------------------------------------------|
|  | OptimisticLockingFailed | Initializes a new instance of the OptimisticLockingFailed class |

See Also

VelocityDb.Indexing Namespace

The `VelocityDB.Indexing` namespace contains classes for the VelocityDB indexing feature

Classes

| Class | Description |
|-------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Index | Use only with IOptimizedPersistable See http://www.velocitydb.com/UserGuide.aspx#_Toc430849968 |
|  IndexDescriptor | |
|  Indexes | Tracks all indexes in a federation |
|  IndexStringByHashCode | Sort string field by a computed hash instead of normal string ordering. |
|  OnePerDatabase | Use this attribute if you want each index to contain objects of a single database, this type of index is stored within the same database as its indexed objects. |
|  UniqueConstraint | Unique index values can be required by using the UniqueConstraint attribute |

Index Class

Use only with [IOptimizedPersistable](#) See http://www.velocitydb.com/UserGuide.aspx#_Toc430849968

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.Indexing.Index

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class Index : Attribute
```

VB

```
Public NotInheritable Class Index
    Inherits Attribute
```

C++

```
public ref class Index sealed : public Attribute
```

F#

```
[<SealedAttribute>]
type Index =
    class
        inherit Attribute
    end
```

The **Index** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Index() | Index by default field which is ld |
|  | Index(String) | Create index by one or more field names separated by comma. First field is used first in lookups then when there is multiple matches, field 2 is used and so on. |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|---------------------------------|
|  | FieldNames | Field names used by this index. |

VelocityDB Class Library

Index Constructor (String)

Create index by one or more field names separated by comma. First field is used first in lookups then when there is multiple matches, field 2 is used and so on.

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Index(  
    string fieldNames  
)
```

VB

```
Public Sub New (  
    fieldNames As String  
)
```

C++

```
public:  
Index(  
    String^ fieldNames  
)
```

F#

```
new :  
    fieldNames : string -> Index
```

Parameters

fieldNames

Type: [System.String](#)

Field names in lookup order separated by comma.

See Also

[Index Class](#)

[Index Overload](#)

[VelocityDb.Indexing Namespace](#)

Index.Index Properties

The [Index](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|---------------------------------|
|  | FieldNames | Field names used by this index. |

See Also

[Index Class](#)

[VelocityDb.Indexing Namespace](#)

Index.FieldNames Property

Field names used by this index.

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string FieldNames { get; }
```

VB

```
Public ReadOnly Property FieldNames As String  
    Get
```

C++

```
public:  
property String^ FieldNames {  
    String^ get ();  
}
```

F#

```
member FieldNames : string with get
```

Property Value

Type: [String](#)

See Also

[Index Class](#)

[VelocityDb.Indexing Namespace](#)

IndexDescriptor Class

[Missing <summary> documentation for "T:VelocityDb.Indexing.IndexDescriptor"]

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Indexing.IndexDescriptor

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#
[SerializableAttribute]
public class IndexDescriptor : OptimizedPersistable
```

```
VB
<SerializableAttribute>
Public Class IndexDescriptor
    Inherits OptimizedPersistable
```

```
C++
[SerializableAttribute]
public ref class IndexDescriptor : public OptimizedPersistable
```

```
F#
[<SerializableAttribute>]
type IndexDescriptor =
    class
        inherit OptimizedPersistable
    end
```

The **IndexDescriptor** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------|----------------------------------------------------------------|
|  | IndexDescriptor(UInt32, UInt32, UInt32) | Initializes a new instance of the IndexDescriptor class |
|  | IndexDescriptor(UInt32, UInt32, Oid) | Initializes a new instance of the IndexDescriptor class |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|-------------|
|  | BTreeld | |

VelocityDB Class Library

| | |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
|  DataMemberShortId | |
|  PlacementDatabaseNumber | (Overrides OptimizedPersistable.PlacementDatabaseNumber.) |
|  ShortRefDatabaseNumber | |
|  TypeShortId | |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

See Also

[VelocityDb.Indexing Namespace](#)

IndexDescriptor Constructor

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------|-------------------------------------------------------------------------|
|  | IndexDescriptor(UInt32, UInt32, UInt32) | Initializes a new instance of the IndexDescriptor class |
|  | IndexDescriptor(UInt32, UInt32, Oid) | Initializes a new instance of the IndexDescriptor class |

See Also

[IndexDescriptor Class](#)

[VelocityDb.Indexing Namespace](#)

IndexDescriptor Constructor (UInt32, UInt32, UInt32)

Initializes a new instance of the [IndexDescriptor](#) class

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IndexDescriptor(  
    uint typeShortId,  
    uint dataMemberShortId = 0,  
    uint databaseId = 0  
)
```

VB

```
Public Sub New (  
    typeShortId As UInteger,  
    Optional dataMemberShortId As UInteger = 0,  
    Optional databaseId As UInteger = 0  
)
```

C++

```
public:  
IndexDescriptor(  
    unsigned int typeShortId,  
    unsigned int dataMemberShortId = 0,  
    unsigned int databaseId = 0  
)
```

F#

```
new :  
    typeShortId : uint32 *  
    ?dataMemberShortId : uint32 *  
    ?databaseId : uint32  
(* Defaults:  
    let _dataMemberShortId = defaultArg dataMemberShortId 0  
    let _databaseId = defaultArg databaseId 0  
*)  
-> IndexDescriptor
```

Parameters

typeShortId

Type: [System.UInt32](#)

[Missing <param name="typeShortId"/> documentation for "M:VelocityDb.Indexing.IndexDescriptor.#ctor(System.UInt32,System.UInt32,System.UInt32)"]

dataMemberShortId (Optional)

Type: [System.UInt32](#)

[Missing <param name="dataMemberShortId"/> documentation for "M:VelocityDb.Indexing.IndexDescriptor.#ctor(System.UInt32,System.UInt32,System.UInt32)"]

databaseId (Optional)

Type: [System.UInt32](#)

[Missing <param name="databaseId"/> documentation for "M:VelocityDb.Indexing.IndexDescriptor.#ctor(System.UInt32,System.UInt32,System.UInt32)"]

[IndexDescriptor Class](#)

[IndexDescriptor Overload](#)

[VelocityDb.Indexing Namespace](#)

IndexDescriptor Constructor (UInt32, UInt32, Oid)

Initializes a new instance of the [IndexDescriptor](#) class

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IndexDescriptor(  
    uint typeShortId,  
    uint dataMemberShortId,  
    Oid bTreeId  
)
```

VB

```
Public Sub New (  
    typeShortId As UInteger,  
    dataMemberShortId As UInteger,  
    bTreeId As Oid  
)
```

C++

```
public:  
IndexDescriptor(  
    unsigned int typeShortId,  
    unsigned int dataMemberShortId,  
    Oid bTreeId  
)
```

F#

```
new :  
    typeShortId : uint32 *  
    dataMemberShortId : uint32 *  
    bTreeId : Oid -> IndexDescriptor
```

Parameters

typeShortId

Type: [System.UInt32](#)

[Missing <param name="typeShortId"/> documentation for "M:VelocityDb.Indexing.IndexDescriptor.#ctor(System.UInt32,System.UInt32,VelocityDb.Oid)"]

dataMemberShortId

Type: [System.UInt32](#)

[Missing <param name="dataMemberShortId"/> documentation for "M:VelocityDb.Indexing.IndexDescriptor.#ctor(System.UInt32,System.UInt32,VelocityDb.Oid)"]

bTreeId

Type: [VelocityDb.Oid](#)

**[Missing <param name="bTreeld"/> documentation for
"M:VelocityDb.Indexing.IndexDescriptor.#ctor(System.UInt32,System.UInt32,VelocityDb.Oid)"]**

VelocityDb.Indexing.Indexes

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#
[SerializableAttribute]
public class Indexes : OptimizedPersistable
```

```
VB
<SerializableAttribute>
Public Class Indexes
    Inherits OptimizedPersistable
```

```
C++
[SerializableAttribute]
public ref class Indexes : public OptimizedPersistable
```

```
F#
[<SerializableAttribute>]
type Indexes =
    class
        inherit OptimizedPersistable
    end
```

The **Indexes** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|--------------------------------------------------------|
|  | Indexes | Initializes a new instance of the Indexes class |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|  | IndexDescriptors | |
|  | PlacementDatabaseNumber | Hint about where to persist DatabaseLocation (Overrides OptimizedPersistable.PlacementDatabaseNumber.) |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------|-------------|
|  | Open | |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |

Indexes.Open Method

[Missing <summary> documentation for

"M:VelocityDb.Indexing.Indexes.Open(VelocityDb.Session.SessionBase,System.Boolean)"]

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static Indexes Open(  
    SessionBase session,  
    bool update  
)
```

VB

```
Public Shared Function Open (  
    session As SessionBase,  
    update As Boolean  
) As Indexes
```

C++

```
public:  
static Indexes^ Open(  
    SessionBase^ session,  
    bool update  
)
```

F#

```
static member Open :  
    session : SessionBase *  
    update : bool -> Indexes
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for

"M:VelocityDb.Indexing.Indexes.Open(VelocityDb.Session.SessionBase,System.Boolean)"]

update

Type: [System.Boolean](#)

Sort string field by a computed hash instead of normal string ordering.

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.Indexing.IndexStringByHashCode

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class IndexStringByHashCode : Attribute
```

VB

```
Public NotInheritable Class IndexStringByHashCode  
    Inherits Attribute
```

C++

```
public ref class IndexStringByHashCode sealed : public Attribute
```

F#

```
[<SealedAttribute>]  
type IndexStringByHashCode =  
    class  
        inherit Attribute  
    end
```

The **IndexStringByHashCode** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------|----------------------------------------------------------------------|
|  | IndexStringByHashCode | Initializes a new instance of the IndexStringByHashCode class |

OnePerDatabase Class

Use this attribute if you want each index to contain objects of a single database, this type of index is stored within the same database as its indexed objects.

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.Indexing.OnePerDatabase

Namespace: [VelocityDb.Indexing](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class OnePerDatabase : Attribute
```

VB

```
Public NotInheritable Class OnePerDatabase  
    Inherits Attribute
```

C++

```
public ref class OnePerDatabase sealed : public Attribute
```

F#

```
[<SealedAttribute>]  
type OnePerDatabase =  
    class  
        inherit Attribute  
    end
```

The **OnePerDatabase** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------|---------------------------------------------------------------|
|  | OnePerDatabase | Initializes a new instance of the OnePerDatabase class |

See Also

[VelocityDb.Indexing Namespace](#)

VelocityDb.Session Namespace

The `VelocityDb.Session` namespace contains session classes for interfacing with VelocityDb

Classes

| Class | Description |
|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ReplicaInfo | Specifies a location for a replica of primary DatabaseLocation containing at least the system databases (0.oddb, 1.oddb, 2.oddb ...) |
|  ServerClientSession | Use this session class when Page level locking is required and/or not all Databases are local and not reachable by UNC paths. |
|  ServerClientSessionShared | Use as a shared session for multiple reader threads connected to one or more VelocityDBServer(s). |
|  SessionBase | Transaction control, database creation and special persistent object api. Each session can use 4,294,967,295 Databases . Each Database may have up to 65,535 Pages and a page can be up to 2 GB in size (.Net restriction of a byte array). The maximum data size a single session can manage is: $4,294,967,295 * 65,535 * 2147483648 = 604453686294542391705600$ bytes or about half a Yottabyte http://en.wikipedia.org/wiki/Yottabyte |
|  SessionBase.Transaction | Helper object to enable automatic rollback/abort of transaction if transaction isn't committed within it's scope. |
|  SessionNoServer | Use this session class when Database level locking is acceptable and Databases are local or reachable by UNC paths. |
|  SessionNoServerShared | Same as SessionNoServer but SessionNoServerShared is thread safe so it can be shared between threads. |
|  SessionPool | Provides a pool of sessions for reuse instead of creating new session instances every time a session is needed. The pooled sessions includes cached databases, pages and objects. Keep the pool size to a minimum too avoid excessive memory usage. |
|  TypeExtensions | Some extensions to Type |

ReplicaInfo Class

Specifies a location for a replica of primary [DatabaseLocation](#) containing at least the system databases (0.odbc, 1.odbc, 2.odbc ...)

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Session.ReplicaInfo

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class ReplicaInfo : IComparable<ReplicaInfo>
```

VB

```
Public Class ReplicaInfo
    Implements IComparable(Of ReplicaInfo)
```

C++

```
public ref class ReplicaInfo : IComparable<ReplicaInfo^>
```

F#

```
type ReplicaInfo =
    class
        interface IComparable<ReplicaInfo>
    end
```

The **ReplicaInfo** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|------------------------------------------------------------|
|  | ReplicaInfo | Initializes a new instance of the ReplicaInfo class |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------|------------------------------------|
|  | Host | Host name (defaults to local host) |
|  | Path | Directory path to databases |

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string Host { get; set; }
```

VB

```
Public Property Host As String  
    Get  
    Set
```

C++

```
public:  
property String^ Host {  
    String^ get ();  
    void set (String^ value);  
}
```

F#

```
member Host : string with get, set
```

Property Value

Type: [String](#)

[VelocityDb.Session.SessionBase](#)

VelocityDb.Session.ServerClientSession

[VelocityDb.Session.ServerClientSessionShared](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class ServerClientSession : SessionBase
```

VB

```
Public Class ServerClientSession
    Inherits SessionBase
```

C++

```
public ref class ServerClientSession : public SessionBase
```

F#

```
type ServerClientSession =
    class
        inherit SessionBase
    end
```

The **ServerClientSession** type exposes the following members.

Constructors

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
|  ServerClientSession(List(ReplicaInfo), Int32, Boolean, Boolean, Boolean, CacheEnum, Boolean) | Initializes a new instance of the ServerClientSession class |
|  ServerClientSession(String, String, Int32, Boolean, Boolean, Boolean, CacheEnum, Boolean) | Creates a new session. |

Properties

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|  AddToIndexInSeperateThread | Indexing thread not yet available with ServerClientSession . (Overrides SessionBase.AddToIndexInSeperateThread .) |
|  WriteToDiskInSeperateDatabaseThreads | Write threads not yet available with ServerClientSession . (Overrides SessionBase.WriteToDiskInSeperateDatabaseThreads .) |

Methods

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Abort | Aborts a transaction, it undoes all persistent changes made within the transaction (Overrides SessionBase.Abort() .) |
|  BeginRead | Transaction control, begin a read only transaction (Overrides SessionBase.BeginRead(Boolean) .) |
|  BeginReadWithEvents | Start a read only transaction and gets a list of created/updated objects as subscribed to by this session |
|  BeginUpdate | Transaction control, begin an update transaction. (Overrides SessionBase.BeginUpdate(Boolean) .) |
|  BeginUpdateWithEvents | Starts a transaction that may be creating new persistent data and/or updating persistent data and gets a list of created/updated objects as subscribed to by this session |
|  ClearServerCache | Used as an aid when debugging server data, internal use, avoid using for now. |
|  Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides SessionBase.Compact() .) |
|  Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides SessionBase.Compact(Database) .) |
|  CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. (Overrides SessionBase.CopyAllDatabasesTo(String, Boolean) .) |
|  DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it (Overrides SessionBase.DeleteLocation(DatabaseLocation, Boolean) .) |
|  FlushUpdates | Send all updated pages to the server(s) managing those pages, freeing up memory in client. (Overrides SessionBase.FlushUpdates() .) |
|  FlushUpdatesServers | Make servers Write all updated data. This may free up some memory on the servers. Only effects sessions using VelocityDbServer(s) (Overrides SessionBase.FlushUpdatesServers() .) |
|  InUseNumberOfPages | Gets the number of pages currently in use by a Database (Overrides SessionBase.InUseNumberOfPages(Database) .) |

| | |
|-------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  NewDatabase | Create a new Database with a given database number (Overrides SessionBase.NewDatabase(UInt32, UInt32, String, Boolean).) |
|  NewLocation | Creates a new DatabaseLocation or updates existing ones (Overrides SessionBase.NewLocation(DatabaseLocation).) |
|  OpenAllDatabases | Open all databases (Overrides SessionBase.OpenAllDatabases(Boolean).) |
|  OpenDatabase | Opens a Database (Overrides SessionBase.OpenDatabase(UInt32, Boolean, Boolean).) |
|  OpenLocationDatabases | Opens all the databases in a given location (Overrides SessionBase.OpenLocationDatabases(DatabaseLocation, Boolean).) |
|  RestoreFrom | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. (Overrides SessionBase.RestoreFrom(DatabaseLocation, DateTime).) |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides SessionBase.SubscribeToChanges(Type, String).) |
|  UnsubscribeToChanges | Unsubscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides SessionBase.UnsubscribeToChanges(Type, String).) |
|  UpdateDatabase | Request an update lock on a database (Overrides SessionBase.UpdateDatabase(Database).) |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport.) |
|  ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv.) |
|  ImportJson(T) | (Defined by JsonImportExport.) |
|  MicrosoftSync | (Defined by Sync.) |

VelocityDB Class Library

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
|  SyncWith(SessionBase) | Overloaded. (Defined by Sync.) |
|  SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync.) |

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession Constructor (List(ReplicaInfo), Int32, Boolean, Boolean, Boolean, CacheEnum, Boolean)

Initializes a new instance of the [ServerClientSession](#) class

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ServerClientSession(
    List<ReplicaInfo> systemHostPath,
    int waitForLockMilliseconds = 2000,
    bool optimisticLocking = true,
    bool inMemoryOnly = false,
    bool enablePageCache = true,
    CacheEnum objectCachingDefaultPolicy = CacheEnum.Yes,
    bool enableDatabaseCache = true
)
```

VB

```
Public Sub New (
    systemHostPath As List(Of ReplicaInfo),
    Optional waitForLockMilliseconds As Integer = 2000,
    Optional optimisticLocking As Boolean = true,
    Optional inMemoryOnly As Boolean = false,
    Optional enablePageCache As Boolean = true,
    Optional objectCachingDefaultPolicy As CacheEnum = CacheEnum.Yes,
    Optional enableDatabaseCache As Boolean = true
)
```

C++

```
public:
ServerClientSession(
    List<ReplicaInfo>^ systemHostPath,
    int waitForLockMilliseconds = 2000,
    bool optimisticLocking = true,
    bool inMemoryOnly = false,
    bool enablePageCache = true,
    CacheEnum objectCachingDefaultPolicy = CacheEnum::Yes,
    bool enableDatabaseCache = true
)
```

F#

```
new :
    systemHostPath : List<ReplicaInfo> *
    ?waitForLockMilliseconds : int *
    ?optimisticLocking : bool *
    ?inMemoryOnly : bool *
    ?enablePageCache : bool *
```

```
?objectCachingDefaultPolicy : CacheEnum *
?enableDatabaseCache : bool
(* Defaults:
    let _waitForLockMilliseconds = defaultArg waitForLockMilliseconds 2000
    let _optimisticLocking = defaultArg optimisticLocking true
    let _inMemoryOnly = defaultArg inMemoryOnly false
    let _enablePageCache = defaultArg enablePageCache true
    let _objectCachingDefaultPolicy = defaultArg
objectCachingDefaultPolicy CacheEnum.Yes
    let _enableDatabaseCache = defaultArg enableDatabaseCache true
*)
-> ServerClientSession
```

Parameters

systemHostPath

Type: [System.Collections.Generic.List<ReplicaInfo>](#)

[Missing <param name="systemHostPath"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

waitForLockMilliseconds (Optional)

Type: [System.Int32](#)

[Missing <param name="waitForLockMilliseconds"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

optimisticLocking (Optional)

Type: [System.Boolean](#)

[Missing <param name="optimisticLocking"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

inMemoryOnly (Optional)

Type: [System.Boolean](#)

[Missing <param name="inMemoryOnly"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

enablePageCache (Optional)

Type: [System.Boolean](#)

[Missing <param name="enablePageCache"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

objectCachingDefaultPolicy (Optional)

Type: [VelocityDb.CacheEnum](#)

[Missing <param name="objectCachingDefaultPolicy"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

enableDatabaseCache (Optional)

Type: [System.Boolean](#)

[Missing <param name="enableDatabaseCache"/> documentation for "M:VelocityDb.Session.ServerClientSession.#ctor(System.Collections.Generic.List{VelocityDb.Session.ReplicaInfo},System.Int32,System.Boolean,System.Boolean,System.Boolean,VelocityDb.CacheEnum,System.Boolean)"]

[ServerClientSession Class](#)

[ServerClientSession Overload](#)

[VelocityDb.Session Namespace](#)

ServerClientSession Constructor (String, String, Int32, Boolean, Boolean, Boolean, CacheEnum, Boolean)

Creates a new session.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ServerClientSession(  
    string systemDir,  
    string systemHost = null,  
    int waitForLockMilliseconds = 2000,  
    bool optimisticLocking = true,  
    bool inMemoryOnly = false,  
    bool enablePageCache = true,  
    CacheEnum objectCachingDefaultPolicy = CacheEnum.Yes,  
    bool enableDatabaseCache = true  
)
```

VB

```
Public Sub New (  
    systemDir As String,  
    Optional systemHost As String = Nothing,  
    Optional waitForLockMilliseconds As Integer = 2000,  
    Optional optimisticLocking As Boolean = true,  
    Optional inMemoryOnly As Boolean = false,  
    Optional enablePageCache As Boolean = true,  
    Optional objectCachingDefaultPolicy As CacheEnum = CacheEnum.Yes,  
    Optional enableDatabaseCache As Boolean = true  
)
```

C++

```
public:  
ServerClientSession(  
    String^ systemDir,  
    String^ systemHost = nullptr,  
    int waitForLockMilliseconds = 2000,  
    bool optimisticLocking = true,  
    bool inMemoryOnly = false,  
    bool enablePageCache = true,  
    CacheEnum objectCachingDefaultPolicy = CacheEnum::Yes,  
    bool enableDatabaseCache = true  
)
```

F#

```
new :  
    systemDir : string *  
    ?systemHost : string *
```

```
?waitForLockMilliseconds : int *
?optimisticLocking : bool *
?inMemoryOnly : bool *
?enablePageCache : bool *
?objectCachingDefaultPolicy : CacheEnum *
?enableDatabaseCache : bool
(* Defaults:
  let_systemHost = defaultArg systemHost null
  let_waitForLockMilliseconds = defaultArg waitForLockMilliseconds 2000
  let_optimisticLocking = defaultArg optimisticLocking true
  let_inMemoryOnly = defaultArg inMemoryOnly false
  let_enablePageCache = defaultArg enablePageCache true
  let_objectCachingDefaultPolicy = defaultArg
objectCachingDefaultPolicy CacheEnum.Yes
  let_enableDatabaseCache = defaultArg enableDatabaseCache true
*)
-> ServerClientSession
```

Parameters

systemDir

Type: [System.String](#)

The startup location directory path (do not use UNC path). Use path as it is on the host owning the directory. Path can be an absolute (full) path or a path relative to **s_baseDatabasePath**. Change default of **s_baseDatabasePath** on server by starting server with a forth parameter specifying the base path

systemHost (Optional)

Type: [System.String](#)

Hostname of the host owning the systemDir

waitForLockMilliseconds (Optional)

Type: [System.Int32](#)

The desired maximum lock wait time

optimisticLocking (Optional)

Type: [System.Boolean](#)

Use optimistic locking. With optimistic locking, readers are always permitted and multiple updaters are permitted to update the same Databases/Pages but only the first transaction to commit or flush an updated Database/Page will be successful in making the commit change. Other updaters will get an `OptimisticLockingException` if they try to commit/flush updates to the same Pages/Database. See http://en.wikipedia.org/wiki/Optimistic_concurrency_control for further explanation of optimistic locking. If optimistic locking is not enabled then pessimistic locking is used. See: http://en.wikipedia.org/wiki/Concurrency_control

inMemoryOnly (Optional)

Type: [System.Boolean](#)

Disable all disk access by using this option. Best if used in combination with backup [DatabaseLocation](#). See High availability sample application

enablePageCache (Optional)

Type: [System.Boolean](#)

VelocityDB Class Library

If strong reference page caching isn't desired, turn it off by setting to false

objectCachingDefaultPolicy (Optional)

Type: [VelocityDb.CacheEnum](#)

Determines default value of [Cache](#)

enableDatabaseCache (Optional)

Type: [System.Boolean](#)

Is this session going to enable strong reference [Database](#) caching?

ServerClientSession.ServerClientSession Methods

The [ServerClientSession](#) type exposes the following members.

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Abort | Aborts a transaction, it undoes all persistent changes made within the transaction (Overrides SessionBase.Abort().) |
|  BeginRead | Transaction control, begin a read only transaction (Overrides SessionBase.BeginRead(Boolean).) |
|  BeginReadWithEvents | Start a read only transaction and gets a list of created/updated objects as subscribed to by this session |
|  BeginUpdate | Transaction control, begin an update transaction. (Overrides SessionBase.BeginUpdate(Boolean).) |
|  BeginUpdateWithEvents | Starts a transaction that may be creating new persistent data and/or updating persistent data and gets a list of created/updated objects as subscribed to by this session |
|  ClearServerCache | Used as an aid when debugging server data, internal use, avoid using for now. |
|  Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides SessionBase.Compact().) |
|  Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides SessionBase.Compact(Database).) |
|  CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. (Overrides SessionBase.CopyAllDatabasesTo(String, Boolean).) |
|  DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it (Overrides SessionBase.DeleteLocation(DatabaseLocation, Boolean).) |
|  FlushUpdates | Send all updated pages to the server(s) managing those pages, freeing up memory in client. (Overrides SessionBase.FlushUpdates().) |
|  FlushUpdatesServers | Make servers Write all updated data. This may free up some memory on the servers. Only effects sessions using VelocityDbServer(s) (Overrides SessionBase.FlushUpdatesServers().) |
|  InUseNumberOfPages | Gets the number of pages currently in use by a Database (Overrides SessionBase.InUseNumberOfPages(Database).) |
|  NewDatabase | Create a new Database with a given database number (Overrides SessionBase.NewDatabase(UInt32, UInt32, String, Boolean).) |
|  NewLocation | Creates a new DatabaseLocation or updates existing ones (Overrides SessionBase.NewLocation(DatabaseLocation).) |
|  OpenAllDatabases | Open all databases (Overrides SessionBase.OpenAllDatabases(Boolean).) |

| | |
|-------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  OpenDatabase | Opens a Database (Overrides SessionBase.OpenDatabase(UInt32, Boolean, Boolean).) |
|  OpenLocationDatabases | Opens all the databases in a given location (Overrides SessionBase.OpenLocationDatabases(DatabaseLocation, Boolean).) |
|  RestoreFrom | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. (Overrides SessionBase.RestoreFrom(DatabaseLocation, DateTime).) |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides SessionBase.SubscribeToChanges(Type, String).) |
|  UnsubscribeToChanges | Unsubscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides SessionBase.UnsubscribeToChanges(Type, String).) |
|  UpdateDatabase | Request an update lock on a database (Overrides SessionBase.UpdateDatabase(Database).) |

Extension Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport.) |
|  ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv.) |
|  ImportJson(T) | (Defined by JsonImportExport.) |
|  MicrosoftSync | (Defined by Sync.) |
|  SyncWith(SessionBase) | Overloaded. (Defined by Sync.) |
|  SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync.) |

ServerClientSession.Abort Method

Aborts a transaction, it undoes all persistent changes made within the transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Abort ()
```

VB

```
Public Overrides Sub Abort
```

C++

```
public:  
virtual void Abort () override
```

F#

```
abstract Abort : unit -> unit  
override Abort : unit -> unit
```

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession.BeginRead Method

Transaction control, begin a read only transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override SessionBase.Transaction BeginRead(  
    bool doRecoveryCheck = false  
)
```

VB

```
Public Overrides Function BeginRead (  
    Optional doRecoveryCheck As Boolean = false  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginRead(  
    bool doRecoveryCheck = false  
) override
```

F#

```
abstract BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction  
override BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

By default we do not check for a failed update transaction that requires reverting one or more database changes. We don't do it by default because it can be a little costly. Change this parameter to `true` if you prefer ensured consistency over better performance or make change only if you encounter an exception in the transaction.

VelocityDB Class Library

Return Value

Type: [SessionBase.Transaction](#)

A transaction helper object.

See Also

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession.BeginReadWithEvents Method

Start a read only transaction and gets a list of created/updated objects as subscribed to by this session

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public List<Oid> BeginReadWithEvents (  
    bool doRecoveryCheck = true  
)
```

VB

```
Public Function BeginReadWithEvents (  
    Optional doRecoveryCheck As Boolean = true  
) As List(Of Oid)
```

C++

```
public:  
List<Oid>^ BeginReadWithEvents (  
    bool doRecoveryCheck = true  
)
```

F#

```
member BeginReadWithEvents :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck true  
)  
-> List<Oid>
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

If true a recovery check is done, otherwise recovery check is bypassed.

Return Value

Type: [List\(Oid\)](#)

list of object Oid of objects updated by other sessions

Transaction control, begin an update transaction.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override SessionBase.Transaction BeginUpdate(  
    bool doRecoveryCheck = true  
)
```

VB

```
Public Overrides Function BeginUpdate (  
    Optional doRecoveryCheck As Boolean = true  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginUpdate(  
    bool doRecoveryCheck = true  
) override
```

F#

```
abstract BeginUpdate :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck true  
)  
-> SessionBase.Transaction  
override BeginUpdate :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck true  
)  
-> SessionBase.Transaction
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

Set to false only when moving system databases to a new directory

Return Value

Type: [SessionBase.Transaction](#)

A [SessionBase.Transaction](#) helper object.

See Also

[VelocityDb.Session Namespace](#)

ServerClientSession.BeginUpdateWithEvents Method

Starts a transaction that may be creating new persistent data and/or updating persistent data and gets a list of created/updated objects as subscribed to by this session

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public List<Oid> BeginUpdateWithEvents (  
    bool doRecoveryCheck = true  
)
```

VB

```
Public Function BeginUpdateWithEvents (  
    Optional doRecoveryCheck As Boolean = true  
) As List(Of Oid)
```

C++

```
public:  
List<Oid>^ BeginUpdateWithEvents (  
    bool doRecoveryCheck = true  
)
```

F#

```
member BeginUpdateWithEvents :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let doRecoveryCheck = defaultArg doRecoveryCheck true  
)  
-> List<Oid>
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

If true a recovery check is done, otherwise recovery check is bypassed.

Return Value

Type: [List\(Oid\)](#)

list of object Oid of objects updated by other sessions

ServerClientSession.Compact Method

Overload List

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides SessionBase.Compact().) |
|  | Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides SessionBase.Compact(Database).) |

ServerClientSession.Compact Method (Database)

Reduce size of database, if possible, by truncating file where unused space begins

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Compact (  
    Database db  
)
```

VB

```
Public Overrides Sub Compact (  
    db As Database  
)
```

C++

```
public:  
virtual void Compact (  
    Database^ db  
) override
```

F#

```
abstract Compact :  
    db : Database -> unit  
override Compact :  
    db : Database -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

[Database](#)

to compact

ServerClientSession.CopyAllDatabasesTo Method

Copies all databases to a selected directory on the local host.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void CopyAllDatabasesTo(  
    string directory,  
    bool systemDatabaseLocationOnly = false  
)
```

VB

```
Public Overrides Sub CopyAllDatabasesTo (  
    directory As String,  
    Optional systemDatabaseLocationOnly As Boolean = false  
)
```

C++

```
public:  
virtual void CopyAllDatabasesTo(  
    String^ directory,  
    bool systemDatabaseLocationOnly = false  
) override
```

F#

```
abstract CopyAllDatabasesTo :  
    directory : string *  
    ?systemDatabaseLocationOnly : bool  
(* Defaults:  
    let_systemDatabaseLocationOnly = defaultArg  
systemDatabaseLocationOnly false  
)  
-> unit  
override CopyAllDatabasesTo :  
    directory : string *  
    ?systemDatabaseLocationOnly : bool  
(* Defaults:  
    let_systemDatabaseLocationOnly = defaultArg  
systemDatabaseLocationOnly false  
)  
-> unit
```

Parameters

directory

Type: [System.String](#)

Path to a directory

VelocityDB Class Library

systemDatabaseLocationOnly (Optional)

Type: [System.Boolean](#)

Only copy databases in system database location

See Also

[ServerClientSession Class](#)

ServerClientSession.DeleteLocation Method

Deletes a [DatabaseLocation](#), location must first not have any Databases in it

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void DeleteLocation(
    DatabaseLocation location,
    bool catalogOnly = false
)
```

VB

```
Public Overrides Sub DeleteLocation (
    location As DatabaseLocation,
    Optional catalogOnly As Boolean = false
)
```

C++

```
public:
    virtual void DeleteLocation(
        DatabaseLocation^ location,
        bool catalogOnly = false
    ) override
```

F#

```
abstract DeleteLocation :
    location : DatabaseLocation *
    ?catalogOnly : bool
(* Defaults:
    let_catalogOnly = defaultArg catalogOnly false
*)
-> unit
override DeleteLocation :
    location : DatabaseLocation *
    ?catalogOnly : bool
(* Defaults:
    let_catalogOnly = defaultArg catalogOnly false
*)
-> unit
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The DatabaseLocation to delete

catalogOnly (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Of true, only delete catalog entry. Leave the directory as is.

ServerClientSession.InUseNumberOfPages Method

Gets the number of pages currently in use by a Database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ushort InUseNumberOfPages (  
    Database db  
)
```

VB

```
Public Overrides Function InUseNumberOfPages (  
    db As Database  
) As UShort
```

C++

```
public:  
virtual unsigned short InUseNumberOfPages (  
    Database^ db  
) override
```

F#

```
abstract InUseNumberOfPages :  
    db : Database -> uint16  
override InUseNumberOfPages :  
    db : Database -> uint16
```

Parameters

db

Type: [VelocityDb.Database](#)

The Database to request info about

Return Value

Type: [UInt16](#)

The number of pages currently in use

See Also

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession.NewDatabase Method

Create a new Database with a given database number

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override Database NewDatabase(
    uint dbNum,
    uint megaBytesPresize = 0,
    string name = null,
    bool signalError = true
)
```

VB

```
Public Overrides Function NewDatabase (
    dbNum As UInteger,
    Optional megaBytesPresize As UInteger = 0,
    Optional name As String = Nothing,
    Optional signalError As Boolean = true
) As Database
```

C++

```
public:
virtual Database^ NewDatabase(
    unsigned int dbNum,
    unsigned int megaBytesPresize = 0,
    String^ name = nullptr,
    bool signalError = true
) override
```

F#

```
abstract NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
    let_megaBytesPresize = defaultArg megaBytesPresize 0
    let_name = defaultArg name null
    let_signalError = defaultArg signalError true
*)
-> Database
override NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
```

VelocityDB Class Library

```
        let_megaBytesPresize = defaultArg megaBytesPresize 0
        let_name = defaultArg name null
        let_signalError = defaultArg signalError true
    *)
    -> Database
```

Parameters

dbNum

Type: [System.UInt32](#)

Database number of the database to create

megaBytesPresize (Optional)

Type: [System.UInt32](#)

If you know that the Database will be large, presizing it may avoid file fragmentation. Default value is 0

name (Optional)

Type: [System.String](#)

Optionally name the new [Database](#)

signalError (Optional)

Type: [System.Boolean](#)

Optionally signal an error if creation of new [Database](#) fails

Return Value

Type: [Database](#)

The newly created [Database](#) or throws an exception if the [Database](#) already exist

```
public:  
virtual DatabaseLocation^ NewLocation(  
    DatabaseLocation^ location  
) override
```

F#

```
abstract NewLocation :  
    location : DatabaseLocation -> DatabaseLocation  
override NewLocation :  
    location : DatabaseLocation -> DatabaseLocation
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The input location

Return Value

Type: [DatabaseLocation](#)

The new DatabaseLocation or an existing one

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession.OpenAllDatabases Method

Open all databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override List<Database> OpenAllDatabases (  
    bool update = false  
)
```

VB

```
Public Overrides Function OpenAllDatabases (  
    Optional update As Boolean = false  
) As List(Of Database)
```

C++

```
public:  
virtual List<Database^>^ OpenAllDatabases (  
    bool update = false  
) override
```

F#

```
abstract OpenAllDatabases :  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
)  
-> List<Database>  
override OpenAllDatabases :  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
)  
-> List<Database>
```

Parameters

update (Optional)

Type: [System.Boolean](#)

Open for update?

Return Value

Type: [List\(Database\)](#)

[Missing <returns> documentation for

"M:VelocityDb.Session.ServerClientSession.OpenAllDatabases(System.Boolean)"]

VelocityDB Class Library

    ?update : bool *
    ?signalError : bool
(* Defaults:
    let_update = defaultArg update false
    let_signalError = defaultArg signalError true
*)
-> Database
```

VelocityDB Class Library

Parameters

dbNum

Type: [System.UInt32](#)

The Database number of the database to open

update (Optional)

Type: [System.Boolean](#)

Open the Database for update?

signalError (Optional)

Type: [System.Boolean](#)

Signal errors if errors found when opening the Database?

Return Value

Type: [Database](#)

The opened Database

See Also

    DatabaseLocation^ location,
    bool update = false
) override
```

F#

```
abstract OpenLocationDatabases :
    location : DatabaseLocation *
    ?update : bool
(* Defaults:
    let_update = defaultArg update false
*)
-> List<Database>
override OpenLocationDatabases :
    location : DatabaseLocation *
    ?update : bool
(* Defaults:
    let_update = defaultArg update false
*)
-> List<Database>
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The location for which to open databases

update (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Shall each database be opened for update?

Return Value

Type: [List\(Database\)](#)

A list of opened databases

See Also

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession.RestoreFrom Method

Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void RestoreFrom(  
    DatabaseLocation backupLocation,  
    DateTime upToTime  
)
```

VB

```
Public Overrides Sub RestoreFrom (  
    backupLocation As DatabaseLocation,  
    upToTime As DateTime  
)
```

C++

```
public:  
virtual void RestoreFrom(  
    DatabaseLocation^ backupLocation,  
    DateTime upToTime  
) override
```

F#

```
abstract RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit  
override RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit
```

Parameters

backupLocation

Type: [VelocityDb.DatabaseLocation](#)

The location to restore from

upToTime

Type: [System.DateTime](#)

Restore location up to a given DateTime. Data backed up after this time will not be restored.

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSession.SubscribeToChanges Method

Subscribe to committed database changes of instances of a type when an optional property evaluates to true.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void SubscribeToChanges (  
    Type aType,  
    string notifyIfTrueProperty = null  
)
```

VB

```
Public Overrides Sub SubscribeToChanges (  
    aType As Type,  
    Optional notifyIfTrueProperty As String = Nothing  
)
```

C++

```
public:  
virtual void SubscribeToChanges (  
    Type^ aType,  
    String^ notifyIfTrueProperty = nullptr  
) override
```

F#

```
abstract SubscribeToChanges :  
    aType : Type *  
    ?notifyIfTrueProperty : string  
(* Defaults:  
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null  
)  
-> unit  
override SubscribeToChanges :  
    aType : Type *  
    ?notifyIfTrueProperty : string  
(* Defaults:  
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null  
)  
-> unit
```

Parameters

aType

Type: [System.Type](#)

The type you are interested in being notified about when persistent instances changes within a database.

notifyIfTrueProperty (Optional)

Type: [System.String](#)

The name of a property part of the type specified as aType, this should be a boolean property. When property returns true, a change notification is send otherwise no notification is send. Leave as null to get a notification any time any instance of the selected type changes

See Also

[ServerClientSession Class](#)

ServerClientSession.UnsubscribeToChanges Method

Unsubscribe to committed database changes of instances of a type when an optional property evaluates to true.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void UnsubscribeToChanges (
    Type aType,
    string notifyIfTrueProperty = null
)
```

VB

```
Public Overrides Sub UnsubscribeToChanges (
    aType As Type,
    Optional notifyIfTrueProperty As String = Nothing
)
```

C++

```
public:
virtual void UnsubscribeToChanges (
    Type^ aType,
    String^ notifyIfTrueProperty = nullptr
) override
```

F#

```
abstract UnsubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
override UnsubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
```

Parameters

aType

Type: [System.Type](#)

The type you are no longer interested in being notified about when persistent instances changes within a database.

VelocityDB Class Library

notifyIfTrueProperty (Optional)

Type: [System.String](#)

The name of a property part of the type specified as aType, this should be a Boolean property.

ServerClientSession.UpdateDatabase Method

Request an update lock on a database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool UpdateDatabase(  
    Database db  
)
```

VB

```
Public Overrides Function UpdateDatabase (  
    db As Database  
) As Boolean
```

C++

```
public:  
virtual bool UpdateDatabase(  
    Database^ db  
) override
```

F#

```
abstract UpdateDatabase :  
    db : Database -> bool  
override UpdateDatabase :  
    db : Database -> bool
```

Parameters

db

Type: [VelocityDb.Database](#)

The database to update

Return Value

Type: [Boolean](#)

true if Database was updated, otherwise throws an exception

See Also

[ServerClientSession Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSessionShared Class

Use as a shared session for multiple reader threads connected to one or more VelocityDBServer(s).

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.Session.SessionBase](#)

[VelocityDb.Session.ServerClientSession](#)

VelocityDb.Session.ServerClientSessionShared

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class ServerClientSessionShared : ServerClientSession
```

VB

```
Public Class ServerClientSessionShared
    Inherits ServerClientSession
```

C++

```
public ref class ServerClientSessionShared : public ServerClientSession
```

F#

```
type ServerClientSessionShared =
    class
        inherit ServerClientSession
    end
```

The **ServerClientSessionShared** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------|------------------------|
|  | ServerClientSessionShared | Creates a new session. |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AddToIndexInSeperateThread | Allow adding objects to indices to be done in a worker thread instead of in main thread. (Overrides ServerClientSession.AddToIndexInSeperateThread.) |
|  | Databases | Gets a list of the currently opened databases (Overrides SessionBase.Databases.) |

| | | |
|--|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | WriteToDiskInSeperateDatabaseThreads | Allow object serialization and page writes to happen in worker threads, one per database, instead of in main session thread. AddToIndexInSeperateThread must also be enabled for this to work. (Overrides ServerClientSession.WriteToDiskInSeperateDatabaseThreads .) |
|--|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Methods

| | Name | Description |
|--|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | Abort | Aborts a transaction, it undoes all persistent changes made within the transaction (Overrides ServerClientSession.Abort() .) |
| | BeginRead | Transaction control, begin a read only transaction (Overrides ServerClientSession.BeginRead(Boolean) .) |
| | BeginUpdate | Transaction control, begin an update transaction. (Overrides ServerClientSession.BeginUpdate(Boolean) .) |
| | Checkpoint | Same as Commit(Boolean, Boolean) followed by BeginUpdate() (Overrides SessionBase.Checkpoint() .) |
| | ClearCache | Clears page cache and closes databases. Avoid using this one for now. (Overrides SessionBase.ClearCache() .) |
| | ClearCachedPages | Clear cache of cached pages (Overrides SessionBase.ClearCachedPages() .) |
| | ClearPageCache | Clears cached pages from cache including page weak references. (Overrides SessionBase.ClearPageCache() .) |
| | Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides ServerClientSession.Compact() .) |
| | Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides ServerClientSession.Compact(Database) .) |
| | CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. (Overrides ServerClientSession.CopyAllDatabasesTo(String, Boolean) .) |
| | CrossTransactionCache | By default databases are only referenced by a WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is |

| | | |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | reopened. (Overrides SessionBase.CrossTransactionCache(Database, Boolean).) |
|  | DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it (Overrides ServerClientSession.DeleteLocation(DatabaseLocation, Boolean).) |
|  | FlushPageOf | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page will also be written. (Overrides SessionBase.FlushPageOf(OptimizedPersistable).) |
|  | FlushUpdates | Send all updated pages to the server(s) managing those pages, freeing up memory in client. (Overrides ServerClientSession.FlushUpdates().) |
|  | FlushUpdatesServers | Make servers Write all updated data. This may free up some memory on the servers. Only effects sessions using VelocityDbServer(s) (Overrides ServerClientSession.FlushUpdatesServers().) |
|  | ForceDatabaseCacheValidation | Cached data is set to be validated whenever a new transaction is started. This function is provided as a way to force cache validation within a transaction without requiring a commit followed by a new transaction. (Overrides SessionBase.ForceDatabaseCacheValidation().) |
|  | GlobalObjWrapperGet | Lookup wrapper object for a non IOptimizedPersistable object (Overrides SessionBase.GlobalObjWrapperGet(Object, IOptimizedPersistable).) |
|  | NewDatabase | Create a new Database with a given database number (Overrides ServerClientSession.NewDatabase(UInt32, UInt32, String, Boolean).) |
|  | NewLocation | Creates a new DatabaseLocation or updates existing ones (Overrides ServerClientSession.NewLocation(DatabaseLocation).) |
|  | Open(UInt64, Boolean, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt64, Boolean, Boolean, Int32).) |
|  | Open(UInt32, UInt16, UInt16, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt32, UInt16, UInt16, Boolean, Int32).) |
|  | Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32) | For internal usage only, used in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32).) |
|  | Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean) | For internal use only in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean).) |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  OpenAllDatabases | Open all databases (Overrides ServerClientSession.OpenAllDatabases(Boolean).) |
|  OpenDatabase | Opens a Database (Overrides ServerClientSession.OpenDatabase(UInt32, Boolean, Boolean).) |
|  OpenLocationDatabases | Opens all the databases in a given location (Overrides ServerClientSession.OpenLocationDatabases(DatabaseLocation, Boolean).) |
|  OpenSchema | Get the session active schema (Overrides SessionBase.OpenSchema(Boolean).) |
|  Persist(IOptimizedPersistable, Nullable(UInt16)) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides PlacementDatabaseNumber and returns something other than DefaultPlacementDatabaseNumber . (Overrides SessionBase.Persist(IOptimizedPersistable, Nullable(UInt16)).) |
|  Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)) | Persists an object (Overrides SessionBase.Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)).) |
|  PossiblyFlushUpdatedPages | Call this function if you may have updated many pages to possibly free up memory if too much memory is in use. (Overrides SessionBase.PossiblyFlushUpdatedPages(UInt32).) |
|  RestoreFrom | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. (Overrides ServerClientSession.RestoreFrom(DatabaseLocation, DateTime).) |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides ServerClientSession.SubscribeToChanges(Type, String).) |
|  Unpersist | Use this when you want to delete objects that are not assignable as IOptimizedPersistable (Overrides SessionBase.Unpersist(Object).) |
|  UpdateDatabase | Request an update lock on a database (Overrides ServerClientSession.UpdateDatabase(Database).) |
|  UpdateObject(Object) | Tag an object as updated so that it will be updated persistently (Overrides SessionBase.UpdateObject(Object).) |
|  UpdateObject(IOptimizedPersistable, Boolean, Boolean) | Updates an object (Overrides SessionBase.UpdateObject(IOptimizedPersistable, Boolean, Boolean).) |

| | | |
|-----------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Verify | Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found. (Overrides SessionBase.Verify() .) |
|-----------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv .) |
|  | ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport .) |
|  | ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport .) |
|  | ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport .) |
|  | ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv .) |
|  | ImportJson(T) | (Defined by JsonImportExport .) |
|  | MicrosoftSync | (Defined by Sync .) |
|  | SyncWith(SessionBase) | Overloaded. (Defined by Sync .) |
|  | SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync .) |

[VelocityDb.Session Namespace](#)

ServerClientSessionShared Constructor

Creates a new session.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ServerClientSessionShared(
    string systemDir,
    string systemHost = null,
    int waitForLockMilliseconds = 2000,
    bool optimisticLocking = true,
    bool inMemoryOnly = false,
    bool enablePageCache = true,
    CacheEnum objectCachingDefaultPolicy = CacheEnum.Yes,
    bool enableDatabaseCache = true
)
```

VB

```
Public Sub New (
    systemDir As String,
    Optional systemHost As String = Nothing,
    Optional waitForLockMilliseconds As Integer = 2000,
    Optional optimisticLocking As Boolean = true,
    Optional inMemoryOnly As Boolean = false,
    Optional enablePageCache As Boolean = true,
    Optional objectCachingDefaultPolicy As CacheEnum = CacheEnum.Yes,
    Optional enableDatabaseCache As Boolean = true
)
```

C++

```
public:
ServerClientSessionShared(
    String^ systemDir,
    String^ systemHost = nullptr,
    int waitForLockMilliseconds = 2000,
    bool optimisticLocking = true,
    bool inMemoryOnly = false,
    bool enablePageCache = true,
    CacheEnum objectCachingDefaultPolicy = CacheEnum::Yes,
    bool enableDatabaseCache = true
)
```

F#

```
new :
    systemDir : string *
    ?systemHost : string *
    ?waitForLockMilliseconds : int *
    ?optimisticLocking : bool *
```

```
?inMemoryOnly : bool *
?enablePageCache : bool *
?objectCachingDefaultPolicy : CacheEnum *
?enableDatabaseCache : bool
(* Defaults:
    let_systemHost = defaultArg systemHost null
    let_waitForLockMilliseconds = defaultArg waitForLockMilliseconds 2000
    let_optimisticLocking = defaultArg optimisticLocking true
    let_inMemoryOnly = defaultArg inMemoryOnly false
    let_enablePageCache = defaultArg enablePageCache true
    let_objectCachingDefaultPolicy = defaultArg
objectCachingDefaultPolicy CacheEnum.Yes
    let_enableDatabaseCache = defaultArg enableDatabaseCache true
*)
-> ServerClientSessionShared
```

Parameters

systemDir

Type: [System.String](#)

The startup location directory path (do not use UNC path). Use path as it is on the host owning the directory. Path can be an absolute (full) path or a path relative to **s_baseDatabasePath**. Change default of **s_baseDatabasePath** on server by starting server with a forth parameter specifying the base path

systemHost (Optional)

Type: [System.String](#)

Hostname of the host owning the systemDir

waitForLockMilliseconds (Optional)

Type: [System.Int32](#)

The desired maximum lock wait time

optimisticLocking (Optional)

Type: [System.Boolean](#)

Use optimistic locking. With optimistic locking, readers are always permitted and multiple updaters are permitted to update the same Databases/Pages but only the first transaction to commit or flush an updated Database/Page will be successful in making the commit change. Other updaters will get an `OptimisticLockingException` if they try to commit/flush updates to the same Pages/Database. See http://en.wikipedia.org/wiki/Optimistic_concurrency_control for further explanation of optimistic locking. If optimistic locking is not enabled then pessimistic locking is used. See: http://en.wikipedia.org/wiki/Concurrency_control

inMemoryOnly (Optional)

Type: [System.Boolean](#)

Disable all disk access by using this option. Best if used in combination with backup [DatabaseLocation](#). See High availability sample application

enablePageCache (Optional)

Type: [System.Boolean](#)

If strong reference page caching isn't desired, turn it of by setting to false

VelocityDB Class Library

objectCachingDefaultPolicy (Optional)

Type: [VelocityDb.CacheEnum](#)

Determines default value of [Cache](#)

enableDatabaseCache (Optional)

Type: [System.Boolean](#)

Is this session going to enable strong reference [Database](#) caching?

ServerClientSessionShared.ServerClientSessionShared Properties

The [ServerClientSessionShared](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AddToIndexInSeperateThread | Allow adding objects to indices to be done in a worker thread instead of in main thread. (Overrides ServerClientSession.AddToIndexInSeperateThread.) |
|  | Databases | Gets a list of the currently opened databases (Overrides SessionBase.Databases.) |
|  | WriteToDiskInSeperateDatabaseThreads | Allow object serialization and page writes to happen in worker threads, one per database, instead of in main session thread. AddToIndexInSeperateThread must also be enabled for this to work. (Overrides ServerClientSession.WriteToDiskInSeperateDatabaseThreads.) |

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.AddToIndexInSeperateThread Property

Allow adding objects to indices to be done in a worker thread instead of in main thread.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool AddToIndexInSeperateThread { get; set; }
```

VB

```
Public Overrides Property AddToIndexInSeperateThread As Boolean  
    Get  
    Set
```

C++

```
public:  
virtual property bool AddToIndexInSeperateThread {  
    bool get () override;  
    void set (bool value) override;  
}
```

F#

```
abstract AddToIndexInSeperateThread : bool with get, set  
override AddToIndexInSeperateThread : bool with get, set
```

Property Value

Type: [Boolean](#)

ServerClientSessionShared.ServerClientSessionShared Methods

The [ServerClientSessionShared](#) type exposes the following members.

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Abort | Aborts a transaction, it undoes all persistent changes made within the transaction (Overrides ServerClientSession.Abort() .) |
|  BeginRead | Transaction control, begin a read only transaction (Overrides ServerClientSession.BeginRead(Boolean) .) |
|  BeginUpdate | Transaction control, begin an update transaction. (Overrides ServerClientSession.BeginUpdate(Boolean) .) |
|  Checkpoint | Same as Commit(Boolean, Boolean) followed by BeginUpdate() (Overrides SessionBase.Checkpoint() .) |
|  ClearCache | Clears page cache and closes databases. Avoid using this one for now. (Overrides SessionBase.ClearCache() .) |
|  ClearCachedPages | Clear cache of cached pages (Overrides SessionBase.ClearCachedPages() .) |
|  ClearPageCache | Clears cached pages from cache including page weak references. (Overrides SessionBase.ClearPageCache() .) |
|  Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides ServerClientSession.Compact() .) |
|  Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides ServerClientSession.Compact(Database) .) |
|  CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. (Overrides ServerClientSession.CopyAllDatabasesTo(String, Boolean) .) |
|  CrossTransactionCache | By default databases are only referenced by a WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened. (Overrides SessionBase.CrossTransactionCache(Database, Boolean) .) |
|  DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it (Overrides |

| | | |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | ServerClientSession.DeleteLocation(DatabaseLocation, Boolean).) |
|  | FlushPageOf | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written. (Overrides SessionBase.FlushPageOf(OptimizedPersistable).) |
|  | FlushUpdates | Send all updated pages to the server(s) managing those pages, freeing up memory in client. (Overrides ServerClientSession.FlushUpdates().) |
|  | FlushUpdatesServers | Make servers Write all updated data. This may free up some memory on the servers. Only effects sessions using VelocityDbServer(s) (Overrides ServerClientSession.FlushUpdatesServers().) |
|  | ForceDatabaseCacheValidation | Cached data is set to be validated whenever a new transaction is started. This function is provided as a way to force cache validation within a transaction without requiring a commit followed by a new transaction. (Overrides SessionBase.ForceDatabaseCacheValidation().) |
|  | GlobalObjWrapperGet | Lookup wrapper object for a non IOptimizedPersistable object (Overrides SessionBase.GlobalObjWrapperGet(Object, IOptimizedPersistable).) |
|  | NewDatabase | Create a new Database with a given database number (Overrides ServerClientSession.NewDatabase(UInt32, UInt32, String, Boolean).) |
|  | NewLocation | Creates a new DatabaseLocation or updates existing ones (Overrides ServerClientSession.NewLocation(DatabaseLocation).) |
|  | Open(UInt64, Boolean, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt64, Boolean, Boolean, Int32).) |
|  | Open(UInt32, UInt16, UInt16, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt32, UInt16, UInt16, Boolean, Int32).) |
|  | Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32) | For internal usage only, used in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32).) |
|  | Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean) | For internal use only in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean).) |
|  | OpenAllDatabases | Open all databases (Overrides ServerClientSession.OpenAllDatabases(Boolean).) |
|  | OpenDatabase | Opens a Database (Overrides ServerClientSession.OpenDatabase(UInt32, Boolean, Boolean).) |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  OpenLocationDatabases | Opens all the databases in a given location (Overrides ServerClientSession.OpenLocationDatabases(DatabaseLocation, Boolean).) |
|  OpenSchema | Get the session active schema (Overrides SessionBase.OpenSchema(Boolean).) |
|  Persist(IOptimizedPersistable, Nullable(UInt16)) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides PlacementDatabaseNumber and returns something other than DefaultPlacementDatabaseNumber . (Overrides SessionBase.Persist(IOptimizedPersistable, Nullable(UInt16)).) |
|  Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)) | Persists an object (Overrides SessionBase.Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)).) |
|  PossiblyFlushUpdatedPages | Call this function if you may have updated many pages to possibly free up memory if too much memory is in use. (Overrides SessionBase.PossiblyFlushUpdatedPages(UInt32).) |
|  RestoreFrom | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. (Overrides ServerClientSession.RestoreFrom(DatabaseLocation, DateTime).) |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides ServerClientSession.SubscribeToChanges(Type, String).) |
|  Unpersist | Use this when you want to delete objects that are not assignable as IOptimizedPersistable (Overrides SessionBase.Unpersist(Object).) |
|  UpdateDatabase | Request an update lock on a database (Overrides ServerClientSession.UpdateDatabase(Database).) |
|  UpdateObject(Object) | Tag an object as updated so that it will be updated persistently (Overrides SessionBase.UpdateObject(Object).) |
|  UpdateObject(IOptimizedPersistable, Boolean, Boolean) | Updates an object (Overrides SessionBase.UpdateObject(IOptimizedPersistable, Boolean, Boolean).) |
|  Verify | Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found. (Overrides SessionBase.Verify().) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  | ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |
|  | ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport.) |
|  | ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport.) |
|  | ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv.) |
|  | ImportJson(T) | (Defined by JsonImportExport.) |
|  | MicrosoftSync | (Defined by Sync.) |
|  | SyncWith(SessionBase) | Overloaded. (Defined by Sync.) |
|  | SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync.) |

ServerClientSessionShared.Abort Method

Aborts a transaction, it undoes all persistent changes made within the transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Abort ()
```

VB

```
Public Overrides Sub Abort
```

C++

```
public:  
virtual void Abort () override
```

F#

```
abstract Abort : unit -> unit  
override Abort : unit -> unit
```

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.BeginRead Method

Transaction control, begin a read only transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override SessionBase.Transaction BeginRead(  
    bool doRecoveryCheck = false  
)
```

VB

```
Public Overrides Function BeginRead (  
    Optional doRecoveryCheck As Boolean = false  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginRead(  
    bool doRecoveryCheck = false  
) override
```

F#

```
abstract BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction  
override BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

By default we do not check for a failed update transaction that requires reverting one or more database changes. We don't do it by default because it can be a little costly. Change this parameter to `true` if you prefer ensured consistency over better performance or make change only if you encounter an exception in the transaction.

VelocityDB Class Library

Return Value

Type: [SessionBase.Transaction](#)

A transaction helper object.

See Also

[ServerClientSessionShared Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.BeginUpdate Method

Transaction control, begin an update transaction.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override SessionBase.Transaction BeginUpdate(  
    bool doRecoveryCheck  
)
```

VB

```
Public Overrides Function BeginUpdate (  
    doRecoveryCheck As Boolean  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginUpdate (  
    bool doRecoveryCheck  
) override
```

F#

```
abstract BeginUpdate :  
    doRecoveryCheck : bool -> SessionBase.Transaction  
override BeginUpdate :  
    doRecoveryCheck : bool -> SessionBase.Transaction
```

Parameters

doRecoveryCheck

Type: [System.Boolean](#)

Set to false only when moving system databases to a new directory

Return Value

Type: [SessionBase.Transaction](#)

A [SessionBase.Transaction](#) helper object.

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.Compact Method

Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each [Database](#) file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Compact ()
```

VB

```
Public Overrides Sub Compact
```

C++

```
public:  
virtual void Compact () override
```

F#

```
abstract Compact : unit -> unit  
override Compact : unit -> unit
```

ServerClientSessionShared.Compact Method (Database)

Reduce size of database, if possible, by truncating file where unused space begins

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Compact (  
    Database db  
)
```

VB

```
Public Overrides Sub Compact (  
    db As Database  
)
```

C++

```
public:  
virtual void Compact (  
    Database^ db  
) override
```

F#

```
abstract Compact :  
    db : Database -> unit  
override Compact :  
    db : Database -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

[Database](#)

to compact

ServerClientSessionShared.CopyAllDatabasesTo Method

Copies all databases to a selected directory on the local host.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void CopyAllDatabasesTo(  
    string directory,  
    bool systemDatabaseLocationOnly  
)
```

VB

```
Public Overrides Sub CopyAllDatabasesTo (  
    directory As String,  
    systemDatabaseLocationOnly As Boolean  
)
```

C++

```
public:  
virtual void CopyAllDatabasesTo(  
    String^ directory,  
    bool systemDatabaseLocationOnly  
) override
```

F#

```
abstract CopyAllDatabasesTo :  
    directory : string *  
    systemDatabaseLocationOnly : bool -> unit  
override CopyAllDatabasesTo :  
    directory : string *  
    systemDatabaseLocationOnly : bool -> unit
```

Parameters

directory

Type: [System.String](#)

Path to a directory

systemDatabaseLocationOnly

Type: [System.Boolean](#)

Only copy databases in system database location

See Also

[ServerClientSessionShared Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.CrossTransactionCache Method

By default databases are only referenced by a [WeakReference](#) across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void CrossTransactionCache (
    Database db,
    bool enable = true
)
```

VB

```
Public Overrides Sub CrossTransactionCache (
    db As Database,
    Optional enable As Boolean = true
)
```

C++

```
public:
virtual void CrossTransactionCache (
    Database^ db,
    bool enable = true
) override
```

F#

```
abstract CrossTransactionCache :
    db : Database *
    ?enable : bool
(* Defaults:
    let _enable = defaultArg enable true
*)
-> unit
override CrossTransactionCache :
    db : Database *
    ?enable : bool
(* Defaults:
    let _enable = defaultArg enable true
*)
-> unit
```

Parameters

db

VelocityDB Class Library

Type: [VelocityDb.Database](#)

The Database to cache

enable (Optional)

Type: [System.Boolean](#)

Add or remove strong reference. If true, add a strong reference

ServerClientSessionShared.DeleteLocation Method

Deletes a [DatabaseLocation](#), location must first not have any Databases in it

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void DeleteLocation(  
    DatabaseLocation location,  
    bool catalogOnly = false  
)
```

VB

```
Public Overrides Sub DeleteLocation (  
    location As DatabaseLocation,  
    Optional catalogOnly As Boolean = false  
)
```

C++

```
public:  
virtual void DeleteLocation(  
    DatabaseLocation^ location,  
    bool catalogOnly = false  
) override
```

F#

```
abstract DeleteLocation :  
    location : DatabaseLocation *  
    ?catalogOnly : bool  
(* Defaults:  
    let_catalogOnly = defaultArg catalogOnly false  
)  
-> unit  
override DeleteLocation :  
    location : DatabaseLocation *  
    ?catalogOnly : bool  
(* Defaults:  
    let_catalogOnly = defaultArg catalogOnly false  
)  
-> unit
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The DatabaseLocation to delete

catalogOnly (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Of true, only delete catalog entry. Leave the directory as is.

ServerClientSessionShared.FlushPageOf Method

By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void FlushPageOf(  
    OptimizedPersistable pObj  
)
```

VB

```
Public Overrides Sub FlushPageOf (  
    pObj As OptimizedPersistable  
)
```

C++

```
public:  
virtual void FlushPageOf(  
    OptimizedPersistable^ pObj  
) override
```

F#

```
abstract FlushPageOf :  
    pObj : OptimizedPersistable -> unit  
override FlushPageOf :  
    pObj : OptimizedPersistable -> unit
```

Parameters

pObj

Type: [VelocityDb.OptimizedPersistable](#)

An object indicating what [Page](#) to flush

See Also

abstract GlobalObjWrapperGet :
    lookupObj : Object *
    pObj : IOptimizedPersistable byref -> bool
override GlobalObjWrapperGet :
    lookupObj : Object *
    pObj : IOptimizedPersistable byref -> bool
```

Parameters

lookupObj

Type: [System.Object](#)

object to look for

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

wrapper object

Return Value

Type: [Boolean](#)

Wrapper object

    unsigned int dbNum,
    unsigned int megaBytesPresize = 0,
    String^ name = nullptr,
    bool signalError = true
) override
```

F#

```
abstract NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
    let_megaBytesPresize = defaultArg megaBytesPresize 0
    let_name = defaultArg name null
    let_signalError = defaultArg signalError true
*)
-> Database
override NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
```

VelocityDB Class Library

```
        let_megaBytesPresize = defaultArg megaBytesPresize 0
        let_name = defaultArg name null
        let_signalError = defaultArg signalError true
    *)
    -> Database
```

Parameters

dbNum

Type: [System.UInt32](#)

Database number of the database to create

megaBytesPresize (Optional)

Type: [System.UInt32](#)

If you know that the Database will be large, presizing it may avoid file fragmentation. Default value is 0

name (Optional)

Type: [System.String](#)

Optionally name the new [Database](#)

signalError (Optional)

Type: [System.Boolean](#)

Optionally signal an error if creation of new [Database](#) fails

Return Value

Type: [Database](#)

The newly created [Database](#) or throws an exception if the [Database](#) already exist

    bool update,  
    bool inFlush,  
    int graphDepthToLoad = 2147483647  
) override
```

F#

```
abstract Open :  
    oid : uint64 *  
    update : bool *  
    inFlush : bool *  
    ?graphDepthToLoad : int  
(* Defaults:  
    let _graphDepthToLoad = defaultArg graphDepthToLoad 2147483647  
*)  
-> Object  
override Open :  
    oid : uint64 *  
    update : bool *  
    inFlush : bool *  
    ?graphDepthToLoad : int  
(* Defaults:
```

```
        let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
*)
-> Object
```

Parameters

oid

Type: [System.UInt64](#)

The Id of the object to open

update

Type: [System.Boolean](#)

Open the object for update?

inFlush

Type: [System.Boolean](#)

if true, disallow page flushing while opening the object

graphDepthToLoad (Optional)

Type: [System.Int32](#)

Set this if you want to limit the depth of the graph loaded by this open.

Return Value

Type: [Object](#)

A persistent object

```
    pageNum : uint16 *
    slotNum : uint16 *
    update : bool *
    ?graphDepthToLoad : int
(* Defaults:
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
*)
-> IOptimizedPersistable
```

Parameters

dbNum

Type: [System.UInt32](#)

Database number of the object to open

pageNum

Type: [System.UInt16](#)

Page number of the object to open

slotNum

Type: [System.UInt16](#)

Slot number of the object to open

update

Type: [System.Boolean](#)

Open the object for update?

graphDepthToLoad (Optional)

Type: [System.Int32](#)

Limit depth of graph to open

Return Value

Type: [IOptimizedPersistable](#)

The opened object or null if it does not exist

    graphDepth : int *
    graphDepthToLoad : int *
    ?signalNotExistError : bool
(* Defaults:
    let_signalNotExistError = defaultArg signalNotExistError false
*)
-> IOptimizedPersistable
```

Parameters

db

Type: [VelocityDb.Database](#)

[Missing <param name="db"/> documentation for "M:VelocityDb.Session.ServerClientSessionShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32,System.Boolean)"]

oid

Type: [System.UInt64](#)

Id of the object to open, must match with Database id

update

Type: [System.Boolean](#)

Update object when opening it

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

Internal list of objects to be loaded as part of graph load

inFlush

Type: [System.Boolean](#)

Permit page flushes as side affect of opening object?

graphDepth

Type: [System.Int32](#)

Current graph depth of graph load

VelocityDB Class Library

graphDepthToLoad

Type: [System.Int32](#)

Max graph depth to load

signalNotExistError (Optional)

Type: [System.Boolean](#)

Signal an exception if object/page/database does not exist.

Return Value

Type: [IOptimizedPersistable](#)

a persistent object

[Open Overload](#)

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.OpenAllDatabases Method

Open all databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override List<Database> OpenAllDatabases (  
    bool update = false  
)
```

VB

```
Public Overrides Function OpenAllDatabases (  
    Optional update As Boolean = false  
) As List(Of Database)
```

C++

```
public:  
virtual List<Database^>^ OpenAllDatabases (  
    bool update = false  
) override
```

F#

```
abstract OpenAllDatabases :  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
*)  
-> List<Database>  
override OpenAllDatabases :  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
*)  
-> List<Database>
```

Parameters

update (Optional)

Type: [System.Boolean](#)

Open for update?

Return Value

Type: [List\(Database\)](#)

[Missing <returns> documentation for

"M:VelocityDb.Session.ServerClientSessionShared.OpenAllDatabases(System.Boolean)"]

    let_signalError = defaultArg signalError true
*)
-> Database
```

VelocityDB Class Library

Parameters

dbNum

Type: [System.UInt32](#)

The Database number of the database to open

update (Optional)

Type: [System.Boolean](#)

Open the Database for update?

signalError (Optional)

Type: [System.Boolean](#)

Signal errors if errors found when opening the Database?

Return Value

Type: [Database](#)

The opened Database

    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
)  
-> List<Database>
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The location for which to open databases

update (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Shall each database be opened for update?

Return Value

Type: [List\(Database\)](#)

A list of opened databases

ServerClientSessionShared.Persist Method (IOptimizedPersistable, Nullable(UInt16))

This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides [PlacementDatabaseNumber](#) and returns something other than [DefaultPlacementDatabaseNumber](#).

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ulong Persist(
    IOptimizedPersistable ipObj,
    ushort? objectsPerPage = null
)
```

VB

```
Public Overrides Function Persist (
    ipObj As IOptimizedPersistable,
    Optional objectsPerPage As UShort? = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    IOptimizedPersistable^ ipObj,
    Nullable<unsigned short> objectsPerPage = nullptr
) override
```

F#

```
abstract Persist :
    ipObj : IOptimizedPersistable *
    ?objectsPerPage : Nullable<uint16>
(* Defaults:
    let _objectsPerPage = defaultArg objectsPerPage null
*)
-> uint64
override Persist :
    ipObj : IOptimizedPersistable *
    ?objectsPerPage : Nullable<uint16>
(* Defaults:
    let _objectsPerPage = defaultArg objectsPerPage null
*)
-> uint64
```

Parameters

ipObj

VelocityDB Class Library

Type: [VelocityDb.IOptimizedPersistable](#)

The object to make persistent

objectsPerPage (Optional)

Type: [System.Nullable\(UInt16\)](#)

Override of objects per page, only respected when persisting first object of some type

Return Value

Type: [UInt64](#)

The Id of the persisted object

See Also

    unsigned short slotLimitPerPage = 0,
    bool inFlush = false,
    Queue<IOptimizedPersistable^>^ toPersist = nullptr
) override
```

F#

```
abstract Persist :
    place : Placement *
    pObj : IOptimizedPersistable *
    schema : Schema *
    ?slotLimitPerPage : uint16 *
    ?inFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
```

```
(* Defaults:
    let_slotLimitPerPage = defaultArg slotLimitPerPage 0
    let_inFlush = defaultArg inFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
override Persist :
    place : Placement *
    pObj : IOptimizedPersistable *
    schema : Schema *
    ?slotLimitPerPage : uint16 *
    ?inFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_slotLimitPerPage = defaultArg slotLimitPerPage 0
    let_inFlush = defaultArg inFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

Placement object determining where to persist the object

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to persist

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active session schema

slotLimitPerPage (Optional)

Type: [System.UInt16](#)

Override of how many slots per page to permit

inFlush (Optional)

Type: [System.Boolean](#)

Set to true to disallow page flushes as a side affect

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A list of objects waiting to be persisted

Return Value

Type: [UInt64](#)

Id of persisted object

ServerClientSessionShared.PossiblyFlushUpdatedPages Method

Call this function if you may have updated many pages to possibly free up memory if too much memory is in use.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void PossiblyFlushUpdatedPages (
    uint numberOfUpdatedPagesPermittedWithoutFlushCheck = 100
)
```

VB

```
Public Overrides Sub PossiblyFlushUpdatedPages (
    Optional numberOfUpdatedPagesPermittedWithoutFlushCheck As UInteger =
100
)
```

C++

```
public:
virtual void PossiblyFlushUpdatedPages (
    unsigned int numberOfUpdatedPagesPermittedWithoutFlushCheck = 100
) override
```

F#

```
abstract PossiblyFlushUpdatedPages :
    ?numberOfUpdatedPagesPermittedWithoutFlushCheck : uint32
(* Defaults:
    let numberOfUpdatedPagesPermittedWithoutFlushCheck = defaultArg
numberOfUpdatedPagesPermittedWithoutFlushCheck 100
*)
-> unit
override PossiblyFlushUpdatedPages :
    ?numberOfUpdatedPagesPermittedWithoutFlushCheck : uint32
(* Defaults:
    let numberOfUpdatedPagesPermittedWithoutFlushCheck = defaultArg
numberOfUpdatedPagesPermittedWithoutFlushCheck 100
*)
-> unit
```

Parameters

numberOfUpdatedPagesPermittedWithoutFlushCheck (Optional)

Type: [System.UInt32](#)

Only do check if the number of updated pages is greater than this number

ServerClientSessionShared.RestoreFrom Method

Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void RestoreFrom(  
    DatabaseLocation backupLocation,  
    DateTime upToTime  
)
```

VB

```
Public Overrides Sub RestoreFrom (  
    backupLocation As DatabaseLocation,  
    upToTime As DateTime  
)
```

C++

```
public:  
virtual void RestoreFrom(  
    DatabaseLocation^ backupLocation,  
    DateTime upToTime  
) override
```

F#

```
abstract RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit  
override RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit
```

Parameters

backupLocation

Type: [VelocityDb.DatabaseLocation](#)

The location to restore from

upToTime

Type: [System.DateTime](#)

Restore location up to a given DateTime. Data backed up after this time will not be restored.

[ServerClientSessionShared Class](#)

[VelocityDb.Session Namespace](#)

ServerClientSessionShared.SubscribeToChanges Method

Subscribe to committed database changes of instances of a type when an optional property evaluates to true.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void SubscribeToChanges (
    Type aType,
    string notifyIfTrueProperty = null
)
```

VB

```
Public Overrides Sub SubscribeToChanges (
    aType As Type,
    Optional notifyIfTrueProperty As String = Nothing
)
```

C++

```
public:
virtual void SubscribeToChanges (
    Type^ aType,
    String^ notifyIfTrueProperty = nullptr
) override
```

F#

```
abstract SubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
override SubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
```

Parameters

aType

Type: [System.Type](#)

The type you are interested in being notified about when persistent instances changes within a database.

notifyIfTrueProperty (Optional)

Type: [System.String](#)

The name of a property part of the type specified as aType, this should be a boolean property. When property returns true, a change notification is send otherwise no notification is send. Leave as null to get a notification any time any instance of the selected type changes

    inFlush : bool *
    ?deleteObjFromIndexes : bool
(* Defaults:
    let _deleteObjFromIndexes = defaultArg deleteObjFromIndexes true
*)
-> bool
```

VelocityDB Class Library

Parameters

obj

Type: [VelocityDb.IOptimizedPersistable](#)

Object to be updated

inFlush

Type: [System.Boolean](#)

Are we doing this as part of a page flush? Set to true to avoid a recursive page flush

deleteObjFromIndexes (Optional)

Type: [System.Boolean](#)

Set to false if you know that this object is not part of any index. Safe to leave set to true in any case

Return Value

Type: [Boolean](#)

True if object is updated; otherwise false

SessionBase Class

Transaction control, database creation and special persistent object api. Each session can use 4,294,967,295 [Databases](#). Each [Database](#) may have up to 65,535 [Pages](#) and a page can be up to 2 GB in size (.Net restriction of a byte array). The maximum data size a single session can manage is: $4,294,967,295 * 65,535 * 2147483648 = 604453686294542391705600$ bytes or about half a Yottabyte <http://en.wikipedia.org/wiki/Yottabyte>

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Session.SessionBase

[VelocityDb.Session.ServerClientSession](#)

[VelocityDb.Session.SessionNoServer](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public abstract class SessionBase : IEnumerable<Database>,
    IEnumerable, IDisposable, IEnlistmentNotification
```

VB

```
Public MustInherit Class SessionBase
    Implements IEnumerable(Of Database), IEnumerable,
    IDisposable, IEnlistmentNotification
```

C++

```
public ref class SessionBase abstract : IEnumerable<Database^>,
    IEnumerable, IDisposable, IEnlistmentNotification
```

F#

```
[<AbstractClassAttribute>]
type SessionBase =
    class
        interface IEnumerable<Database>
        interface IEnumerable
        interface IDisposable
        interface IEnlistmentNotification
    end
```

The **SessionBase** type exposes the following members.

Properties

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AddToIndexInSeperateThread | Allow adding objects to indices to be done in a worker thread instead of in main thread. |
|  AssumeLocalHost | SessionNoServer ignores DatabaseLocation host value, it assumes localhost, ServerSessionClient does not assume local host, it follows the DatabaseLocation HostName value. |
|   BaseDatabasePath | If specified boot path (system database path) in session constructor isn't an absolute path then this base path is prefixed to make an absolute path. |
|   BTreeAddFastTransientBatchSize | Default batch size for BTree AddFast api, initially set to 100 |
|   ClearAllCachedObjectsWhenDetectingUpdatedDatabase | By default we clear all cached object when at the beginning of a transaction we detect an updated Database within our cached databases. Same logic is applied when calling ForceDatabaseCacheValidation() . We do so because most of the time an object in one database have (strong) references to objects in other databases. If Database A is NOT updated but database B is and an object in database A is cached with a strong reference to an object in database B then our cached object in database A may contain a stale/incorrect reference to object in database B. This is why we, by default, invalidate all cached objects when we detect a modified database within our cached databases. However, if you design your database schema without strong references between databases then you do not need to invalidate cached objects for other databases, only the ones that have changed. By consistently using WeakIOptimizedPersistableReference(T) , BTreeSet(Key) and BTreeMap(Key, Value) , you can keep references weak between databases. In such cases, set this property to false. |
|  ClientCache | Gets the client page cache object |
|  DatabaseLocations | Gets the DatabaseLocations DatabaseLocations for the session. |
|  Databases | Gets a list of the currently opened databases |
|   DefaultCompressPages | By default false, set to true if you want to change the default for newly created DatabaseLocation . |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  DefaultNumberOfObjectsPerPage  | Default number of objects per page is 9999 |
|  DefaultStringComparer  | Set the StringComparer to use when no application provided comparator is provided. By default we will then use StringComparer.Ordinal. |
|  DeletedOids | Collected Oid for unpersisted objects within an update transaction. Ids are only collected if NotifyBeforeCommit is non null. |
|  DoWindowsAuthentication  | By default do not use windows authentication when talking to VelocitydbServer's on other hosts. |
|  EmbedSerializableLists  | Starting in version 7.1.6, List(T) bits are NOT by default stored with its parent object, instead each such List(T) is stored with its own object Id. This change was necessary in order to handle circular references via List(T) objects within an ISerializable serialization. Set this value to true if you have existing persisted ISerializable with List(T) or else we will try to read the lists as non embedded when they are not. |
|  EnableAutoPageFlush | Pages may be flushed when memory available is low unless you set tis property to false. You would want it to be enabled unless you are trying to share a non SessionNoServerShared session by working on different databases in multiple threads. As in Wikipedia sample application. |
|  EnableSyncByTrackingChanges | Enable database and page change tracking. Turn off within an update transaction so that prior change set can be deleted. |
|  FileBytesChunkSize  | When transferring complete files from a server, we send the file bytes in chunks of this size. |
|  FileShareReader | FileShare for reader is ReadWrite with optimistic locking; otherwise Read |
|  FileShareUpdater | FileShare for updater is Read with optimistic locking; otherwise None |
|  InCommit | Indicates if we are within a transaction commit. |
|  InMemoryOnly | Gets information about this session, is it an in-memory only session or a session that persists data |
|  InTransaction | Indicates if we are within an active transaction. |
|  InUpdateTransaction | Indicates if we are within an active update transaction. |

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  IsDisposed | Check if session has been disposed |
|  LocalHost  | Get the host name of your local host (the machine you are using) |
|  MaxStringLengthToIntern  | Get the maximum size a string must have before VelocityDB internals interns, Intern(String) , string when read from a Database . |
|  MaxUpdateTransactionLogHistory  | Determines max number of UpdateTransaction objects we maintain in update transaction log in Database 0, initially set to 9990 |
|  MinStringLengthToIntern  | Get the minimum size a string must have before VelocityDB internals interns, Intern(String) , string when read from a Database . |
|  NewDatabases | Get a list of all new databases created within this transaction |
|  NewOids | Collected Oid for newly persisted objects within an update transaction. Ids are only collected if NotifyBeforeCommit is non null. |
|  NotifyBeforeCommit | Set to an Action of your choice if you want to get notified right before commit of an update transaction. |
|  ObjectCachingDefaultPolicy | Get/Set default value for Cache |
|  OptimisticLocking | Is the active Database and/or Page locking using optimistic locking model or not? See https://en.wikipedia.org/wiki/Optimistic_concurrency_control and https://en.wikipedia.org/wiki/Record_locking |
|  StrongReferenceDatabaseCaching | Is current session caching Databases using strong references or just by weak references. Set in session constructor or by calling CrossTransactionCacheAllDatabases(Boolean) . |
|  SystemDirectory | Get the path to the directory of the system Databases (0.oddb, 1.oddb, 2.oddb ...) of this session. |
|  SystemHostName | Get the host name of the system Databases (0.oddb, 1.oddb, 2.oddb ...) of this session. |
|  TextEncoding  | All text encoding is done with utf8 |
|  TraceDBActivity | |
|  TraceIndexUsage | If set to true, each time an index (BTreeSet) is used in a LINQ query expression, we output a line about that to the console output. |
|  TransactionNumber | Gets the transaction number of the current session |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  UpdatedOids | Collected Oid for updated objects within an update transaction. Ids are only collected if NotifyBeforeCommit is non null. |
|  UseExternalStorageApi | This is specifically for Windows Phone API, set to true when you want to access databases from a memory card. |
|  WaitForLockMilliseconds | Get/Set the max time waiting for a lock to clear with pessimistic locking |
|  WriteToDiskInSeperateDatabaseThreads | Allow object serialization and page writes to happen in worker threads, one per database, instead of in main session thread. AddToIndexInSeperateThread must also be enabled for this to work. |

Methods

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Abort | Transaction control, abort the current transaction |
|  AllObjects(T) | Gets an object used for enumerating all objects in all Databases |
|  AnyPageWritten | Find out if any pages have been written for a given database in this update transaction |
|  BeginRead | Transaction control, begin a read only transaction |
|  BeginUpdate() | Transaction control, begin an update transaction. |
|  BeginUpdate(Boolean) | Transaction control, begin an update transaction. |
|  Checkpoint | Same as Commit(Boolean, Boolean) followed by BeginUpdate() |
|  ClearCache | Clears page cache and closes databases. Avoid using this one for now. |
|  ClearCachedObjects() | Clears the cache of cached objects. |
|  ClearCachedObjects(Database) | Clears the cache of cached objects within a Database . |
|  ClearCashedPages | Clear cache of cached pages |
|  ClearPageCache | Clears cached pages from cache including page weak references. |
|  CloseDatabase | Closes a Database |
|  Commit | Transaction control, commit the current transaction |
|  Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. |

| | |
|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins |
|  CompareTo | The default compare of two SessionBase is by system (bootup) host name and directory |
|  ContainsDatabase | Check if database file exist in a given DatabaseLocation |
|  CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. |
|  CreateDirectory | Creates a directory |
|  CrossTransactionCache | By default databases are only referenced by a WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened. |
|  CrossTransactionCacheAllDatabases | By default databases are referenced by strong references instead of WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to all Databases so the cached Database may be used if version wasn't changed by a different thread since prior transaction. A strong reference is removed for any database that get invalidated due to a transaction abort or if another transaction commits a change to it. Check current session state with StrongReferenceDatabaseCaching |
|  DatabaseNumberOf | Get the database number associated with a specific type. Your application can store any type of object in any database but if the application exclusively use Persist(IOptimizedPersistable, Nullable(UInt16)) or Persist(Object) then this is the database Id that will be used given a type. |
|  DatabaseStillExist | Check if Database still exist |
|  DefaultDatabaseLocation | Gets the default (startup) DatabaseLocation |
|  DeleteDatabase | Delete a database, actual database file delete happens after a successful transaction commit. |
|  DeleteFile | Delete a file. For internal use. |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it |
|  DeleteObject | A way to delete an object without requiring that the object be opened first |
|  DeletePage | Deletes a page from a database. (part of database Sync beta version - not yet fully designed and tested) Used by SyncWith when syncing databases with another replica of the current databases |
|  DeployGenerateReaderWriter | Part of code generator, not yet ready for public release |
|  DeployInternalTypes | For internal use only |
|  Dispose | Closes this session |
|  FileOpen(Database, FileAccess, String, FileMode, Boolean, Int32, Boolean) | Opens a Database file for read/update. Internal use only. |
|  FileOpen(FileInfo, FileAccess, String, FileShare, FileMode, Int32, Boolean, Boolean) | For internal use. |
|  FirstFreePage | Gets the page number of the first unallocated page in the specified Database |
|  FlushPageOf | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written. |
|  FlushUpdates() | Write all updated data. This may free up some memory. |
|  FlushUpdates(Database) | Write any updated/new pages for a specific Database |
|  FlushUpdatesServers | Make servers Write all updated data. This may free up some memory on the servers. Only effects sessions using VelocityDbServer(s) |
|  ForceDatabaseCacheValidation | Cached data is set to be validated whenever a new transaction is started. This function is provided as a way to force cache validation within a transaction without requiring a commit followed by a new transaction. |
|  GetEnumerator | Enumerates all open databases for this session |
|  GetVersion | Gets the version of Database 0 |
|  GlobalObjWrapperGet | Lookup wrapper object for a non IOptimizedPersistable object |
|  HighestInUseDatabaseNumber | Figure out what the highest in use database number is and return it. |
|  HighestInUseLocalDatabaseNumber | Figure out what the highest in use database number is on the local host and return it. |
|  IdOf | Finds the object id of a persistent object |

| | |
|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Index(T)() | Gets an index of all objects of a certain type |
|  Index(T)(String) | Gets an index of all objects of a certain type |
|  Index(T)(Database) | Gets an index of all objects of a certain type within a given database (attribute OnePerDatabase must be used). If you have updated objects persisted in a prior transaction that you want part of an index. Call FlushUpdates() or call Write()/> to add such an object to index before querying using an index./> |
|  Index(T)(String, Database) | Gets an index of all objects of a certain type within a given database (attribute OnePerDatabase must be used) |
|  InUseNumberOfPages | Gets the number of pages currently in use by a Database |
|  IsSameHost | Determine if two host names represent the same tcp/ip host |
|  IsWorkerThread | Tell if code is executed by index or page write worker thread |
|  LoadFields | Loads all field values of an object if they are not already loaded. |
|  LocateDb | Lookup the DatabaseLocation of a Database with a specified database number. |
|  NewDatabase | Create a new Database with a given database number |
|  NewLocation | Creates a new DatabaseLocation or updates existing ones |
|  Objects(T) | Enumerates all the objects of a given type |
|  OfType | Gets an object used for enumerating all objects in all Databases |
|  OidOf | Finds the object id of a persistent object |
|  OidShortOf | Finds the object id of a persistent object |
|  OpenAllDatabases | Open all databases |
|  OpenDatabase | Opens a Database |
|  OpenDatabaseLocations | Open the DatabaseLocations object and store it in the session. |
|  OpenLocationDatabases | Opens all the databases in a given location |
|  OpenPage | Opens a page for read, used by DatabaseManager for page browsing |
|  OpenSchema | Get the session active schema |
|  ParseCsvRow | Parses a row in a csv file and returns an iterator of column string values |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Persist(Object) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database. |
|  Persist(IOptimizedPersistable, Nullable(UInt16)) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides PlacementDatabaseNumber and returns something other than DefaultPlacementDatabaseNumber . |
|  Persist(Placement, IOptimizedPersistable) | Persist an object that is an OptimizedPersistable or a subclass |
|  Persist(Object, IOptimizedPersistable, Boolean) | Persist an object that may or may not be a subclass of OptimizedPersistable |
|  Persist(Object, Placement, Boolean) | Persist an object that may or may not be a subclass of OptimizedPersistable |
|  Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)) | Persists an object |
|  PossiblyFlushUpdatedPages | Call this function if you may have updated many pages to possibly free up memory if too much memory is in use. |
|  RegisterClass | Register a class in the persistent schema. It is a good idea to do this explicitly instead of having it happen the first time an object of an unregistered class is made persistent |
|  RelocateDatabaseLocationFor | After moving/copying directory containing your Database with id dbId call this before starting a transaction to update host and directory of the associated DatabaseLocation . This function does not move the database files, it only updates the DatabaseLocation . |
|  RelocateDefaultDatabaseLocation | After moving/copying directory containing your Databases 0.oddb, 1.oddb ... call this before starting a transaction to update host and directory of the default DatabaseLocation . This function does not move the database files, it only updates the DatabaseLocation . |
|  ReplacePage | Only to be used in VelocityDbExtensions while syncing databases |
|  ReplacePersistedType(String, Type) | Updates the Type associated with a VelocityDbType . This can be used when you want to rename a class or move a class to a different namespace. You will need to have the prior Type loaded as it is defined in the current Schema for this to work. Once the update has been done, you should no longer need to keep the old |

| | | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | Type loaded. Be sure to backup all your data before doing this. |
|  | ReplacePersistedType(Type, Type) | Updates the Type associated with a VelocityDbType . This can be used when you want to rename a class or move a class to a different namespace. You will need to have the prior Type loaded as it is defined in the current Schema for this to work. Once the update has been done, you should no longer need to keep the old Type loaded. Be sure to backup all your data before doing this. |
|  | RestoreFrom(DatabaseLocation, DateTime) | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. |
|  | RestoreFrom(String, String, UInt32, DateTime) | Restores a DatabaseLocation |
|   | SetMinMaxStringIntern | A persistent string read into memory from a Database is interned using Intern(String) to speed up comparisons and conserve memory (when the same string occurs in many places) |
|  | SetTraceAllDbActivity | Enable some Trace output about persistent events related to all databases and pages. Add a Trace listener to get to Console window: Trace.Listeners.Add(new ConsoleTraceListener()); |
|  | SetTraceDbActivity | Enable some Trace output about persistent events related to a Database. Add a Trace listener to get to Console window: Trace.Listeners.Add(new ConsoleTraceListener()); |
|   | StringToType | Gets a Type given a string representation of a type |
|  | SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. |
|  | TryDatabase | Gets the current database to try |
|  | Unpersist | Use this when you want to delete objects that are not assignable as IOptimizedPersistable |
|  | UnsubscribeToChanges | Unsubscribe to committed database changes of instances of a type when an optional property evaluates to true. |
|  | UpdateClass | Let VelocityDB know that changes have been made to a class so that the schema manager will create a new TypeVersion and use the new version for all new objects of the specified Type. |

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|  UpdateDatabase | Request an update lock on a database |
|  UpdateObject(Object) | Tag an object as updated so that it will be updated persistently |
|  UpdateObject(IOptimizedPersistable) | Tag an object as updated so that it will be updated persistently |
|  UpdateObject(Object, Action) | Provides a way to update an object in a multi threaded scenario where we must make sure that object page isn't flushed until updates to object are done. |
|  UpdateObject(IOptimizedPersistable, Action) | Provides a way to update an object in a multi threaded scenario where we must make sure that object page isn't flushed until updates to object are done. |
|  UpdateObject(IOptimizedPersistable, Boolean, Boolean) | Updates an object |
|  UpdatePage | Update a Page . Used by VelocityDBExtensions project |
|  Verify | Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found. |
|  WaitForIndexUpdates | Internal Use and in VelocityDBExtensions |
|  WritePageBytes | |

Fields

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Assembly  | |
|  IndexDescriptorDatabaseNumber  | Database 3 is dedicated to keeping track of index usage |
|  s_serverTcpIpPortNumber  | By default port number 7031 (7032 if .net core) is used for communication with VelocityDBServer. Change the value here and also in VelocityDbServer.exe.config if you need to use a different port number. |
|  s_typeDatabaseIdOffsetFromTypeShortId  | Determines database Id to use for a certain VelocityDbType instance |
|  s_typeDatabaseIdOverflowIndexCollisionOffset  | If additional databases are required for storing instances of some index, start by attempting creating database at this offset from original |
|  s_typeDatabaseIdOverflowOffset  | If additional databases are required for storing instances of some type, start by attempting creating database at this offset from original |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  | ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |
|  | ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport.) |
|  | ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport.) |
|  | ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv.) |
|  | ImportJson(T) | (Defined by JsonImportExport.) |
|  | MicrosoftSync | (Defined by Sync.) |
|  | SyncWith(SessionBase) | Overloaded. (Defined by Sync.) |
|  | SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync.) |

[VelocityDb.Session Namespace](#)

SessionBase.SessionBase Properties

The [SessionBase](#) type exposes the following members.

Properties

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AddToIndexInSeperateThread | Allow adding objects to indices to be done in a worker thread instead of in main thread. |
|  AssumeLocalHost | SessionNoServer ignores DatabaseLocation host value, it assumes localhost, ServerSessionClient does not assume local host, it follows the DatabaseLocation HostName value. |
|  BaseDatabasePath  | If specified boot path (system database path) in session constructor isn't an absolute path then this base path is prefixed to make an absolute path. |
|  BTreeAddFastTransientBatchSize  | Default batch size for BTree AddFast api, initially set to 100 |
|  ClearAllCachedObjectsWhenDetectingUpdatedDatabase  | By default we clear all cached object when at the beginning of a transaction we detect an updated Database within our cached databases. Same logic is applied when calling ForceDatabaseCacheValidation() . We do so because most of the time an object in one database have (strong) references to objects in other databases. If Database A is NOT updated but database B is and an object in database A is cached with a strong reference to an object in database B then our cached object in database A may contain a stale/incorrect reference to object in database B. This is why we, by default, invalidate all cached objects when we detect a modified database within our cached databases. However, if you design your database schema without strong references between databases then you do not need to invalidate cached objects for other databases, only the ones that have changed. By consistently using WeakIOptimizedPersistableReference(T) , BTreeSet(Key) and BTreeMap(Key, Value) , you can keep references weak between databases. In such cases, set this property to false. |
|  ClientCache | Gets the client page cache object |
|  DatabaseLocations | Gets the DatabaseLocations DatabaseLocations for the session. |
|  Databases | Gets a list of the currently opened databases |

| | |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  DefaultCompressPages | By default false, set to true if you want to change the default for newly created DatabaseLocation . |
|  DefaultNumberOfObjectsPerPage | Default number of objects per page is 9999 |
|  DefaultStringComparer | Set the StringComparer to use when no application provided comparator is provided. By default we will then use StringComparer.Ordinal. |
|  DeletedOids | Collected Oid for unpersisted objects within an update transaction. Ids are only collected if NotifyBeforeCommit is non null. |
|  DoWindowsAuthentication | By default do not use windows authentication when talking to VelocitydbServer's on other hosts. |
|  EmbedSerializableLists | Starting in version 7.1.6, List(T) bits are NOT by default stored with its parent object, instead each such List(T) is stored with its own object Id. This change was necessary in order to handle circular references via List(T) objects within an ISerializable serialization. Set this value to true if you have existing persisted ISerializable with List(T) or else we will try to read the lists as non embedded when they are not. |
|  EnableAutoPageFlush | Pages may be flushed when memory available is low unless you set tis property to false. You would want it to be enabled unless you are trying to share a non SessionNoServerShared session by working on different databases in multiple threads. As in Wikipedia sample application. |
|  EnableSyncByTrackingChanges | Enable database and page change tracking. Turn off within an update transaction so that prior change set can be deleted. |
|  FileBytesChunkSize | When transferring complete files from a server, we send the file bytes in chunks of this size. |
|  FileShareReader | FileShare for reader is ReadWrite with optimistic locking; otherwise Read |
|  FileShareUpdater | FileShare for updater is Read with optimistic locking; otherwise None |
|  InCommit | Indicates if we are within a transaction commit. |
|  InMemoryOnly | Gets information about this session, is it an in-memory only session or a session that persists data |
|  InTransaction | Indicates if we are within an active transaction. |

| | |
|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  InUpdateTransaction | Indicates if we are within an active update transaction. |
|  IsDisposed | Check if session has been disposed |
|  LocalHost | Get the host name of your local host (the machine you are using) |
|  MaxStringLengthToIntern | Get the maximum size a string must have before VelocityDB internals interns, Intern(String) , string when read from a Database . |
|  MaxUpdateTransactionLogHistory | Determines max number of UpdateTransaction objects we maintain in update transaction log in Database 0, initially set to 9990 |
|  MinStringLengthToIntern | Get the minimum size a string must have before VelocityDB internals interns, Intern(String) , string when read from a Database . |
|  NewDatabases | Get a list of all new databases created within this transaction |
|  NewOids | Collected Oid for newly persisted objects within an update transaction. Ids are only collected if NotifyBeforeCommit is non null. |
|  NotifyBeforeCommit | Set to an Action of your choice if you want to get notified right before commit of an update transaction. |
|  ObjectCachingDefaultPolicy | Get/Set default value for Cache |
|  OptimisticLocking | Is the active Database and/or Page locking using optimistic locking model or not? See https://en.wikipedia.org/wiki/Optimistic_concurrency_control and https://en.wikipedia.org/wiki/Record_locking |
|  StrongReferenceDatabaseCaching | Is current session caching Databases using strong references or just by weak references. Set in session constructor or by calling CrossTransactionCacheAllDatabases(Boolean) . |
|  SystemDirectory | Get the path to the directory of the system Databases (0.oddb, 1.oddb, 2.oddb ...) of this session. |
|  SystemHostName | Get the host name of the system Databases (0.oddb, 1.oddb, 2.oddb ...) of this session. |
|  TextEncoding | All text encoding is done with utf8 |
|  TraceDBActivity | |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  TraceIndexUsage | If set to true, each time an index (BTreeSet) is used in a LINQ query expression, we output a line about that to the console output. |
|  TransactionNumber | Gets the transaction number of the current session |
|  UpdatedOids | Collected Oid for updated objects within an update transaction. Ids are only collected if NotifyBeforeCommit is non null. |
|  UseExternalStorageApi | This is specifically for Windows Phone API, set to true when you want to access databases from a memory card. |
|  WaitForLockMilliseconds | Get/Set the max time waiting for a lock to clear with pessimistic locking |
|  WriteToDiskInSeperateDatabaseThreads | Allow object serialization and page writes to happen in worker threads, one per database, instead of in main session thread. AddToIndexInSeperateThread must also be enabled for this to work. |

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.AddToIndexInSeperateThread Property

Allow adding objects to indices to be done in a worker thread instead of in main thread.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool AddToIndexInSeperateThread { get; set; }
```

VB

```
Public Overridable Property AddToIndexInSeperateThread As Boolean  
    Get  
    Set
```

C++

```
public:  
virtual property bool AddToIndexInSeperateThread {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
abstract AddToIndexInSeperateThread : bool with get, set  
override AddToIndexInSeperateThread : bool with get, set
```

Property Value

Type: [Boolean](#)

See Also

[SessionBase Class](#)

SessionBase.AssumeLocalHost Property

SessionNoServer ignores DatabaseLocation host value, it assumes localhost, ServerSessionClient does not assume local host, it follows the DatabaseLocation HostName value.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool AssumeLocalHost { get; }
```

VB

```
Public Overridable ReadOnly Property AssumeLocalHost As Boolean  
    Get
```

C++

```
public:  
virtual property bool AssumeLocalHost {  
    bool get ();  
}
```

F#

```
abstract AssumeLocalHost : bool with get  
override AssumeLocalHost : bool with get
```

Property Value

Type: [Boolean](#)

See Also

SessionBase.BaseDatabasePath Property

If specified boot path (system database path) in session constructor isn't an absolute path then this base path is prefixed to make an absolute path.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static string BaseDatabasePath { get; set; }
```

VB

```
Public Shared Property BaseDatabasePath As String  
    Get  
    Set
```

C++

```
public:  
static property String^ BaseDatabasePath {  
    String^ get ();  
    void set (String^ value);  
}
```

F#

```
static member BaseDatabasePath : string with get, set
```

Property Value

Type: [String](#)

SessionBase.ClearAllCachedObjectsWhenDetectingUpdatedDatabase Property

By default we clear all cached object when at the beginning of a transaction we detect an updated [Database](#) within our cached databases. Same logic is applied when calling [ForceDatabaseCacheValidation\(\)](#). We do so because most of the time an object in one database have (strong) references to objects in other databases. If Database A is NOT updated but database B is and an object in database A is cached with a strong reference to an object in database B then our cached object in database A may contain a stale/incorrect reference to object in database B. This is why we, by default, invalidate all cached objects when we detect a modified database within our cached databases. However, if you design your database schema without strong references between databases then you do not need to invalidate cached objects for other databases, only the ones that have changed. By consistently using [WeakIOptimizedPersistableReference\(T\)](#), [BTreeSet\(Key\)](#) and [BTreeMap\(Key, Value\)](#), you can keep references weak between databases. In such cases, set this property to false.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool ClearAllCachedObjectsWhenDetectingUpdatedDatabase { get; set; }
```

VB

```
Public Shared Property ClearAllCachedObjectsWhenDetectingUpdatedDatabase As Boolean
    Get
    Set
```

C++

```
public:
    static property bool ClearAllCachedObjectsWhenDetectingUpdatedDatabase {
        bool get ();
        void set (bool value);
    }
```

F#

```
static member ClearAllCachedObjectsWhenDetectingUpdatedDatabase : bool with
    get, set
```

Property Value

Type: [Boolean](#)

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.EmbedSerializableLists Property

Starting in version 7.1.6, [List\(T\)](#) bits are NOT by default stored with its parent object, instead each such [List\(T\)](#) is stored with its own object Id. This change was necessary in order to handle circular references via [List\(T\)](#) objects within an [ISerializable](#) serialization. Set this value to true if you have existing persisted [ISerializable](#) with [List\(T\)](#) or else we will try to read the lists as non embedded when they are not.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool EmbedSerializableLists { get; set; }
```

VB

```
Public Shared Property EmbedSerializableLists As Boolean  
    Get  
    Set
```

C++

```
public:  
static property bool EmbedSerializableLists {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
static member EmbedSerializableLists : bool with get, set
```

Property Value

Type: [Boolean](#)

SessionBase.TraceDBActivity Property

[Missing <summary> documentation for "P:VelocityDb.Session.SessionBase.TraceDBActivity"]

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SortedSet<uint> TraceDBActivity { get; }
```

VB

```
Public ReadOnly Property TraceDBActivity As SortedSet(Of UInteger)  
    Get
```

C++

```
public:  
property SortedSet<unsigned int>^ TraceDBActivity {  
    SortedSet<unsigned int>^ get ();  
}
```

F#

```
member TraceDBActivity : SortedSet<uint32> with get
```

Property Value

Type: [SortedSet\(UInt32\)](#)

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.TraceIndexUsage Property

If set to true, each time an index (BTreeSet) is used in a LINQ query expression, we output a line about that to the console output.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool TraceIndexUsage { get; set; }
```

VB

```
Public Property TraceIndexUsage As Boolean  
    Get  
    Set
```

C++

```
public:  
property bool TraceIndexUsage {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
member TraceIndexUsage : bool with get, set
```

Property Value

Type: [Boolean](#)

See Also

SessionBase.TransactionNumber Property

Gets the transaction number of the current session

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong TransactionNumber { get; }
```

VB

```
Public ReadOnly Property TransactionNumber As ULong  
    Get
```

C++

```
public:  
property unsigned long long TransactionNumber {  
    unsigned long long get ();  
}
```

F#

```
member TransactionNumber : uint64 with get
```

Property Value

Type: [UInt64](#)

The transaction number

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.UpdatedOids Property

Collected [Oid](#) for updated objects within an update transaction. Ids are only collected if [NotifyBeforeCommit](#) is non null.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public HashSet<Oid> UpdatedOids { get; }
```

VB

```
Public ReadOnly Property UpdatedOids As HashSet(Of Oid)  
    Get
```

C++

```
public:  
property HashSet<Oid>^ UpdatedOids {  
    HashSet<Oid>^ get ();  
}
```

F#

```
member UpdatedOids : HashSet<Oid> with get
```

Property Value

Type: [HashSet\(Oid\)](#)

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.UseExternalStorageApi Property

This is specifically for Windows Phone API, set to true when you want to access databases from a memory card.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool UseExternalStorageApi { get; set; }
```

VB

```
Public Property UseExternalStorageApi As Boolean  
    Get  
    Set
```

C++

```
public:  
property bool UseExternalStorageApi {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
member UseExternalStorageApi : bool with get, set
```

Property Value

Type: [Boolean](#)

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.WaitForLockMilliseconds Property

Get/Set the max time waiting for a lock to clear with pessimistic locking

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int WaitForLockMilliseconds { get; set; }
```

VB

```
Public Property WaitForLockMilliseconds As Integer  
    Get  
    Set
```

C++

```
public:  
property int WaitForLockMilliseconds {  
    int get ();  
    void set (int value);  
}
```

F#

```
member WaitForLockMilliseconds : int with get, set
```

Property Value

Type: [Int32](#)

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.WriteToDiskInSeperateDatabaseThreads Property

Allow object serialization and page writes to happen in worker threads, one per database, instead of in main session thread. [AddToIndexInSeperateThread](#) must also be enabled for this to work.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool WriteToDiskInSeperateDatabaseThreads { get; set; }
```

VB

```
Public Overridable Property WriteToDiskInSeperateDatabaseThreads As Boolean  
    Get  
    Set
```

C++

```
public:  
virtual property bool WriteToDiskInSeperateDatabaseThreads {  
    bool get ();  
    void set (bool value);  
}
```

F#

```
abstract WriteToDiskInSeperateDatabaseThreads : bool with get, set  
override WriteToDiskInSeperateDatabaseThreads : bool with get, set
```

Property Value

Type: [Boolean](#)

See Also

SessionBase.SessionBase Methods

The [SessionBase](#) type exposes the following members.

Methods

| Name | Description |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Abort | Transaction control, abort the current transaction |
| AllObjects(T) | Gets an object used for enumerating all objects in all Databases |
| AnyPageWritten | Find out if any pages have been written for a given database in this update transaction |
| BeginRead | Transaction control, begin a read only transaction |
| BeginUpdate() | Transaction control, begin an update transaction. |
| BeginUpdate(Boolean) | Transaction control, begin an update transaction. |
| Checkpoint | Same as Commit(Boolean, Boolean) followed by BeginUpdate() |
| ClearCache | Clears page cache and closes databases. Avoid using this one for now. |
| ClearCachedObjects() | Clears the cache of cached objects. |
| ClearCachedObjects(Database) | Clears the cache of cached objects within a Database . |
| ClearCachedPages | Clear cache of cached pages |
| ClearPageCache | Clears cached pages from cache including page weak references. |
| CloseDatabase | Closes a Database |
| Commit | Transaction control, commit the current transaction |
| Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. |
| Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins |
| CompareTo | The default compare of two SessionBase is by system (bootup) host name and directory |
| ContainsDatabase | Check if database file exist in a given DatabaseLocation |
| CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. |
| CreateDirectory | Creates a directory |
| CrossTransactionCache | By default databases are only referenced by a WeakReference across transaction boundaries. This |

| | | |
|-------------------------------------------------------------------------------------|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened. |
|  | CrossTransactionCacheAllDatabases | By default databases are referenced by strong references instead of WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to all Databases so the cached Database may be used if version wasn't changed by a different thread since prior transaction. A strong reference is removed for any database that get invalidated due to a transaction abort or if another transaction commits a change to it. Check current session state with StrongReferenceDatabaseCaching |
|  | DatabaseNumberOf | Get the database number associated with a specific type. Your application can store any type of object in any database but if the application exclusively use Persist(IOptimizedPersistable, Nullable(UInt16)) or Persist(Object) then this is the database Id that will be used given a type. |
|  | DatabaseStillExist | Check if Database still exist |
|  | DefaultDatabaseLocation | Gets the default (startup) DatabaseLocation |
|  | DeleteDatabase | Delete a database, actual database file delete happens after a successful transaction commit. |
|  | DeleteFile | Delete a file. For internal use. |
|  | DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it |
|  | DeleteObject | A way to delete an object without requiring that the object be opened first |
|  | DeletePage | Deletes a page from a database. (part of database Sync beta version - not yet fully designed and tested) Used by SyncWith when syncing databases with another replica of the current databases |
|  | DeployGenerateReaderWriter | Part of code generator, not yet ready for public release |
|  | DeployInternalTypes | For internal use only |
|  | Dispose | Closes this session |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  FileOpen(Database, FileAccess, String, FileMode, Boolean, Int32, Boolean) | Opens a Database file for read/update. Internal use only. |
|  FileOpen(FileInfo, FileAccess, String, FileShare, FileMode, Int32, Boolean, Boolean) | For internal use. |
|  FirstFreePage | Gets the page number of the first unallocated page in the specified Database |
|  FlushPageOf | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written. |
|  FlushUpdates() | Write all updated data. This may free up some memory. |
|  FlushUpdates(Database) | Write any updated/new pages for a specific Database |
|  FlushUpdatesServers | Make servers Write all updated data. This may free up some memory on the servers. Only effects sessions using VelocityDbServer(s) |
|  ForceDatabaseCacheValidation | Cached data is set to be validated whenever a new transaction is started. This function is provided as a way to force cache validation within a transaction without requiring a commit followed by a new transaction. |
|  GetEnumerator | Enumerates all open databases for this session |
|  GetVersion | Gets the version of Database 0 |
|  GlobalObjWrapperGet | Lookup wrapper object for a non IOptimizedPersistable object |
|  HighestInUseDatabaseNumber | Figure out what the highest in use database number is and return it. |
|  HighestInUseLocalDatabaseNumber | Figure out what the highest in use database number is on the local host and return it. |
|  IdOf | Finds the object id of a persistent object |
|  Index(T)() | Gets an index of all objects of a certain type |
|  Index(T)(String) | Gets an index of all objects of a certain type |
|  Index(T)(Database) | Gets an index of all objects of a certain type within a given database (attribute OnePerDatabase must be used). If you have updated objects persisted in a prior transaction that you want part of an index. Call FlushUpdates() or call Write()/> to add such an object to index before querying using an index./> |
|  Index(T)(String, Database) | Gets an index of all objects of a certain type within a given database (attribute OnePerDatabase must be used) |
|  InUseNumberOfPages | Gets the number of pages currently in use by a Database |

| | |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  IsSameHost  | Determine if two host names represent the same tcp/ip host |
|  IsWorkerThread | Tell if code is executed by index or page write worker thread |
|  LoadFields | Loads all field values of an object if they are not already loaded. |
|  LocateDb | Lookup the DatabaseLocation of a Database with a specified database number. |
|  NewDatabase | Create a new Database with a given database number |
|  NewLocation | Creates a new DatabaseLocation or updates existing ones |
|  Objects(T) | Enumerates all the objects of a given type |
|  OfType | Gets an object used for enumerating all objects in all Databases |
|  OidOf | Finds the object id of a persistent object |
|  OidShortOf | Finds the object id of a persistent object |
|  OpenAllDatabases | Open all databases |
|  OpenDatabase | Opens a Database |
|  OpenDatabaseLocations | Open the DatabaseLocations object and store it in the session. |
|  OpenLocationDatabases | Opens all the databases in a given location |
|  OpenPage | Opens a page for read, used by DatabaseManager for page browsing |
|  OpenSchema | Get the session active schema |
|  ParseCsvRow  | Parses a row in a csv file and returns an iterator of column string values |
|  Persist(Object) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database. |
|  Persist(IOptimizedPersistable, Nullable(UInt16)) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides PlacementDatabaseNumber and returns something other than DefaultPlacementDatabaseNumber . |
|  Persist(Placement, IOptimizedPersistable) | Persist an object that is an OptimizedPersistable or a subclass |
|  Persist(Object, IOptimizedPersistable, Boolean) | Persist an object that may or may not be a subclass of OptimizedPersistable |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Persist(Object, Placement, Boolean) | Persist an object that may or may not be a subclass of OptimizedPersistable |
|  Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)) | Persists an object |
|  PossiblyFlushUpdatedPages | Call this function if you may have updated many pages to possibly free up memory if too much memory is in use. |
|  RegisterClass | Register a class in the persistent schema. It is a good idea to do this explicitly instead of having it happen the first time an object of an unregistered class is made persistent |
|  RelocateDatabaseLocationFor | After moving/copying directory containing your Database with id dbId call this before starting a transaction to update host and directory of the associated DatabaseLocation . This function does not move the database files, it only updates the DatabaseLocation . |
|  RelocateDefaultDatabaseLocation | After moving/copying directory containing your Databases 0.odb, 1.odb ... call this before starting a transaction to update host and directory of the default DatabaseLocation . This function does not move the database files, it only updates the DatabaseLocation . |
|  ReplacePage | Only to be used in VelocityDbExtensions while syncing databases |
|  ReplacePersistedType(String, Type) | Updates the Type associated with a VelocityDbType . This can be used when you want to rename a class or move a class to a different namespace. You will need to have the prior Type loaded as it is defined in the current Schema for this to work. Once the update has been done, you should no longer need to keep the old Type loaded. Be sure to backup all your data before doing this. |
|  ReplacePersistedType(Type, Type) | Updates the Type associated with a VelocityDbType . This can be used when you want to rename a class or move a class to a different namespace. You will need to have the prior Type loaded as it is defined in the current Schema for this to work. Once the update has been done, you should no longer need to keep the old Type loaded. Be sure to backup all your data before doing this. |
|  RestoreFrom(DatabaseLocation, DateTime) | Restores Databases and pages from a backup DatabaseLocation . Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. |

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  RestoreFrom(String, String, UInt32, DateTime) | Restores a DatabaseLocation |
|   SetMinMaxStringIntern | A persistent string read into memory from a Database is interned using Intern(String) to speed up comparisons and conserve memory (when the same string occurs in many places) |
|  SetTraceAllDbActivity | Enable some Trace output about persistent events related to all databases and pages. Add a Trace listener to get to Console window: <code>Trace.Listeners.Add(new ConsoleTraceListener());</code> |
|  SetTraceDbActivity | Enable some Trace output about persistent events related to a Database. Add a Trace listener to get to Console window: <code>Trace.Listeners.Add(new ConsoleTraceListener());</code> |
|   StringToType | Gets a Type given a string representation of a type |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. |
|  TryDatabase | Gets the current database to try |
|  Unpersist | Use this when you want to delete objects that are not assignable as IOptimizedPersistable |
|  UnsubscribeToChanges | Unsubscribe to committed database changes of instances of a type when an optional property evaluates to true. |
|  UpdateClass | Let VelocityDB know that changes have been made to a class so that the schema manager will create a new TypeVersion and use the new version for all new objects of the specified Type. |
|  UpdateDatabase | Request an update lock on a database |
|  UpdateObject(Object) | Tag an object as updated so that it will be updated persistently |
|  UpdateObject(IOptimizedPersistable) | Tag an object as updated so that it will be updated persistently |
|  UpdateObject(Object, Action) | Provides a way to update an object in a multi threaded scenario where we must make sure that object page isn't flushed until updates to object are done. |
|  UpdateObject(IOptimizedPersistable, Action) | Provides a way to update an object in a multi threaded scenario where we must make sure that object page isn't flushed until updates to object are done. |
|  UpdateObject(IOptimizedPersistable, Boolean, Boolean) | Updates an object |

| | |
|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
|  UpdatePage | Update a Page . Used by VelocityDBExtensions project |
|  Verify | Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found. |
|  WaitForIndexUpdates | Internal Use and in VelocityDBExtensions |
|  WritePageBytes | |

Extension Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport.) |
|  ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv.) |
|  ImportJson(T) | (Defined by JsonImportExport.) |
|  MicrosoftSync | (Defined by Sync.) |
|  SyncWith(SessionBase) | Overloaded. (Defined by Sync.) |
|  SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync.) |

SessionBase.Abort Method

Transaction control, abort the current transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void Abort ()
```

VB

```
Public Overridable Sub Abort
```

C++

```
public:  
virtual void Abort ()
```

F#

```
abstract Abort : unit -> unit  
override Abort : unit -> unit
```

See Also

[VelocityDb.Session Namespace](#)

SessionBase.AllObjects(T) Method

Gets an object used for enumerating all objects in all Databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public AllObjects<T> AllObjects<T>(
    bool includeSubclasses = true,
    bool databasePerType = true
)
```

VB

```
Public Function AllObjects(Of T) (
    Optional includeSubclasses As Boolean = true,
    Optional databasePerType As Boolean = true
) As AllObjects(Of T)
```

C++

```
public:
generic<typename T>
AllObjects<T>^ AllObjects(
    bool includeSubclasses = true,
    bool databasePerType = true
)
```

F#

```
member AllObjects :
    ?includeSubclasses : bool *
    ?databasePerType : bool
(* Defaults:
    let _includeSubclasses = defaultArg includeSubclasses true
    let _databasePerType = defaultArg databasePerType true
*)
-> AllObjects<'T>
```

Parameters

includeSubclasses (Optional)

Type: [System.Boolean](#)

Also return instances of sub classes or classes that implements the specified interface class

databasePerType (Optional)

Type: [System.Boolean](#)

Assume that persisted objects were made persistent the simple way using [Persist\(IOptimizedPersistable, Nullable\(UInt16\)\)](#). When persisting this way, each object type gets its own [Database](#) which makes finding these objects easier and faster

Type Parameters

T

The type of object we are looking for

Return Value

Type: [AllObjects\(T\)](#)

The enumeration wrapper object

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.AnyPageWritten Method

Find out if any pages have been written for a given database in this update transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool AnyPageWritten(  
    Database db  
)
```

VB

```
Public Function AnyPageWritten (  
    db As Database  
) As Boolean
```

C++

```
public:  
bool AnyPageWritten(  
    Database^ db  
)
```

F#

```
member AnyPageWritten :  
    db : Database -> bool
```

Parameters

db

Type: [VelocityDb.Database](#)

The database of interest

Return Value

Type: [Boolean](#)

true if any pages have been written, otherwise false

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.BeginRead Method

Transaction control, begin a read only transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual SessionBase.Transaction BeginRead(  
    bool doRecoveryCheck = false  
)
```

VB

```
Public Overridable Function BeginRead (  
    Optional doRecoveryCheck As Boolean = false  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginRead(  
    bool doRecoveryCheck = false  
)
```

F#

```
abstract BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction  
override BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

By default we do not check for a failed update transaction that requires reverting one or more database changes. We don't do it by default because it can be a little costly. Change this parameter to `true` if you prefer ensured consistency over better performance or make change only if you encounter an exception in the transaction.

VelocityDB Class Library

Return Value

Type: [SessionBase.Transaction](#)

A transaction helper object.

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.BeginUpdate Method

Transaction control, begin an update transaction.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SessionBase.Transaction BeginUpdate ()
```

VB

```
Public Function BeginUpdate As SessionBase.Transaction
```

C++

```
public:  
SessionBase.Transaction^ BeginUpdate ()
```

F#

```
member BeginUpdate : unit -> SessionBase.Transaction
```

Return Value

Type: [SessionBase.Transaction](#)

A [SessionBase.Transaction](#) helper object.

[BeginUpdate Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.BeginUpdate Method (Boolean)

Transaction control, begin an update transaction.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual SessionBase.Transaction BeginUpdate(  
    bool doRecoveryCheck  
)
```

VB

```
Public Overridable Function BeginUpdate (  
    doRecoveryCheck As Boolean  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginUpdate(  
    bool doRecoveryCheck  
)
```

F#

```
abstract BeginUpdate :  
    doRecoveryCheck : bool -> SessionBase.Transaction  
override BeginUpdate :  
    doRecoveryCheck : bool -> SessionBase.Transaction
```

Parameters

doRecoveryCheck

Type: [System.Boolean](#)

Set to false only when moving system databases to a new directory

Return Value

Type: [SessionBase.Transaction](#)

A [SessionBase.Transaction](#) helper object.

See Also

[SessionBase Class](#)

[BeginUpdate Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.Checkpoint Method

Same as [Commit\(Boolean, Boolean\)](#) followed by [BeginUpdate\(\)](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual SessionBase.Transaction Checkpoint ()
```

VB

```
Public Overridable Function Checkpoint As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ Checkpoint ()
```

F#

```
abstract Checkpoint : unit -> SessionBase.Transaction  
override Checkpoint : unit -> SessionBase.Transaction
```

Return Value

Type: [SessionBase.Transaction](#)

[SessionBase.Transaction](#) started

SessionBase.ClearCachedObjects Method (Database)

Clears the cache of cached objects within a [Database](#).

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public void ClearCachedObjects (  
    Database db  
)
```

```
VB  
Public Sub ClearCachedObjects (  
    db As Database  
)
```

```
C++  
public:  
void ClearCachedObjects (  
    Database^ db  
)
```

```
F#  
member ClearCachedObjects :  
    db : Database -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

Clear cached objects within this database.

SessionBase.CloseDatabase Method

Closes a Database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CloseDatabase (  
    Database db  
)
```

VB

```
Public Sub CloseDatabase (  
    db As Database  
)
```

C++

```
public:  
void CloseDatabase (  
    Database^ db  
)
```

F#

```
member CloseDatabase :  
    db : Database -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

The Database to close

See Also

[SessionBase Class](#)

SessionBase.Commit Method

Transaction control, commit the current transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Commit(  
    bool doRecoveryCheck = true,  
    bool isRestore = false  
)
```

VB

```
Public Sub Commit (  
    Optional doRecoveryCheck As Boolean = true,  
    Optional isRestore As Boolean = false  
)
```

C++

```
public:  
void Commit(  
    bool doRecoveryCheck = true,  
    bool isRestore = false  
)
```

F#

```
member Commit :  
    ?doRecoveryCheck : bool *  
    ?isRestore : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck true  
    let _isRestore = defaultArg isRestore false  
)  
-> unit
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

Only case for not doing it is when committing a [RestoreFrom\(String, String, UInt32, DateTime\)](#)

isRestore (Optional)

Type: [System.Boolean](#)

Inform session that this is part of a restore

SessionBase.CompareTo Method

The default compare of two SessionBase is by system (bootup) host name and directory

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int CompareTo(  
    SessionBase otherSession  
)
```

VB

```
Public Function CompareTo (  
    otherSession As SessionBase  
) As Integer
```

C++

```
public:  
int CompareTo(  
    SessionBase^ otherSession  
)
```

F#

```
member CompareTo :  
    otherSession : SessionBase -> int
```

Parameters

otherSession

Type: [VelocityDb.Session.SessionBase](#)

The session to compare with

Return Value

Type: [Int32](#)

-1 if this session is less than the other, 0 if equal, otherwise 1

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.ContainsDatabase Method

Check if database file exist in a given [DatabaseLocation](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool ContainsDatabase(  
    DatabaseLocation location,  
    uint dbNum,  
    string extension = ".odb"  
)
```

VB

```
Public Overridable Function ContainsDatabase (  
    location As DatabaseLocation,  
    dbNum As UInteger,  
    Optional extension As String = ".odb"  
) As Boolean
```

C++

```
public:  
virtual bool ContainsDatabase(  
    DatabaseLocation^ location,  
    unsigned int dbNum,  
    String^ extension = L".odb"  
)
```

F#

```
abstract ContainsDatabase :  
    location : DatabaseLocation *  
    dbNum : uint32 *  
    ?extension : string  
(* Defaults:  
    let _extension = defaultArg extension ".odb"  
*)  
-> bool  
override ContainsDatabase :  
    location : DatabaseLocation *  
    dbNum : uint32 *  
    ?extension : string  
(* Defaults:  
    let _extension = defaultArg extension ".odb"  
*)  
-> bool
```

Parameters

location

VelocityDB Class Library

Type: [VelocityDb.DatabaseLocation](#)

Location to check

dbNum

Type: [System.UInt32](#)

Database number/id

extension (Optional)

Type: [System.String](#)

File name extension/id

Return Value

Type: [Boolean](#)

true if exist; otherwise false

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.CopyAllDatabasesTo Method

Copies all databases to a selected directory on the local host.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void CopyAllDatabasesTo(  
    string directory,  
    bool systemDatabaseLocationOnly = false  
)
```

VB

```
Public Overridable Sub CopyAllDatabasesTo (  
    directory As String,  
    Optional systemDatabaseLocationOnly As Boolean = false  
)
```

C++

```
public:  
virtual void CopyAllDatabasesTo(  
    String^ directory,  
    bool systemDatabaseLocationOnly = false  
)
```

F#

```
abstract CopyAllDatabasesTo :  
    directory : string *  
    ?systemDatabaseLocationOnly : bool  
(* Defaults:  
    let_systemDatabaseLocationOnly = defaultArg  
systemDatabaseLocationOnly false  
)  
-> unit  
override CopyAllDatabasesTo :  
    directory : string *  
    ?systemDatabaseLocationOnly : bool  
(* Defaults:  
    let_systemDatabaseLocationOnly = defaultArg  
systemDatabaseLocationOnly false  
)  
-> unit
```

Parameters

directory

Type: [System.String](#)

Path to a directory

VelocityDB Class Library

systemDatabaseLocationOnly (Optional)

Type: [System.Boolean](#)

[Missing <param name="systemDatabaseLocationOnly"/> documentation for "M:VelocityDb.Session.SessionBase.CopyAllDatabasesTo(System.String,System.Boolean)"]

    String^ path  
)
```

F#

```
abstract CreateDirectory :  
    path : string -> bool  
override CreateDirectory :  
    path : string -> bool
```

Parameters

path

Type: [System.String](#)

Return Value

Type: [Boolean](#)

true if path exist; otherwise false

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.CrossTransactionCache Method

By default databases are only referenced by a [WeakReference](#) across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void CrossTransactionCache (
    Database db,
    bool enable = true
)
```

VB

```
Public Overridable Sub CrossTransactionCache (
    db As Database,
    Optional enable As Boolean = true
)
```

C++

```
public:
virtual void CrossTransactionCache (
    Database^ db,
    bool enable = true
)
```

F#

```
abstract CrossTransactionCache :
    db : Database *
    ?enable : bool
(* Defaults:
    let _enable = defaultArg enable true
*)
-> unit
override CrossTransactionCache :
    db : Database *
    ?enable : bool
(* Defaults:
    let _enable = defaultArg enable true
*)
-> unit
```

Parameters

db

VelocityDB Class Library

Type: [VelocityDb.Database](#)

The Database to cache

enable (Optional)

Type: [System.Boolean](#)

Add or remove strong reference. If true, add a strong reference

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.CrossTransactionCacheAllDatabases Method

By default databases are referenced by strong references instead of [WeakReference](#) across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to all Databases so the cached Database may be used if version wasn't changed by a different thread since prior transaction. A strong reference is removed for any database that get invalidated due to a transaction abort or if another transaction commits a change to it. Check current session state with [StrongReferenceDatabaseCaching](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void CrossTransactionCacheAllDatabases (  
    bool enable = true  
)
```

VB

```
Public Sub CrossTransactionCacheAllDatabases (  
    Optional enable As Boolean = true  
)
```

C++

```
public:  
void CrossTransactionCacheAllDatabases (  
    bool enable = true  
)
```

F#

```
member CrossTransactionCacheAllDatabases :  
    ?enable : bool  
(* Defaults:  
    let _enable = defaultArg enable true  
*)  
-> unit
```

Parameters

enable (Optional)

Type: [System.Boolean](#)

Add or remove strong reference. If true, add a strong reference

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.DatabaseNumberOf Method

Get the database number associated with a specific type. Your application can store any type of object in any database but if the application exclusively use [Persist\(IOptimizedPersistable, Nullable\(UInt16\)\)](#) or [Persist\(Object\)](#) then this is the database Id that will be used given a type.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint DatabaseNumberOf (
    Type type
)
```

VB

```
Public Function DatabaseNumberOf (
    type As Type
) As UInteger
```

C++

```
public:
    unsigned int DatabaseNumberOf (
        Type^ type
    )
```

F#

```
member DatabaseNumberOf :
    type : Type -> uint32
```

Parameters

type

Type: [System.Type](#)

The type for which you want to get the associated database number (Id)

Return Value

Type: [UInt32](#)

The database number associated with the provided type

See Also

[SessionBase Class](#)

SessionBase.DatabaseStillExist Method

Check if [Database](#) still exist

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool DatabaseStillExist(  
    Database db  
)
```

VB

```
Public Overridable Function DatabaseStillExist (  
    db As Database  
) As Boolean
```

C++

```
public:  
virtual bool DatabaseStillExist(  
    Database^ db  
)
```

F#

```
abstract DatabaseStillExist :  
    db : Database -> bool  
override DatabaseStillExist :  
    db : Database -> bool
```

Parameters

db

Type: [VelocityDb.Database](#)

[Database](#)

to check

Return Value

Type: [Boolean](#)

true if exists; otherwise false

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.DefaultDatabaseLocation Method

Gets the default (startup) DatabaseLocation

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual DatabaseLocation DefaultDatabaseLocation()
```

VB

```
Public Overridable Function DefaultDatabaseLocation As DatabaseLocation
```

C++

```
public:  
virtual DatabaseLocation^ DefaultDatabaseLocation()
```

F#

```
abstract DatabaseLocation : unit -> DatabaseLocation  
override DatabaseLocation : unit -> DatabaseLocation
```

Return Value

Type: [DatabaseLocation](#)

The [DatabaseLocation](#) containing at least the system [Databases](#) (0.odb, 1.odb, 2.odb, 3.odb and 4.odb)

See Also

[SessionBase Class](#)

SessionBase.DeleteDatabase Method

Delete a database, actual database file delete happens after a successful transaction commit.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void DeleteDatabase (  
    Database db  
)
```

VB

```
Public Sub DeleteDatabase (  
    db As Database  
)
```

C++

```
public:  
void DeleteDatabase (  
    Database^ db  
)
```

F#

```
member DeleteDatabase :  
    db : Database -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

The [Database](#) to delete

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.DeleteFile Method

Delete a file. For internal use.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public virtual void DeleteFile(  
    FileInfo fileInfo  
)
```

```
VB  
Public Overridable Sub DeleteFile (  
    fileInfo As FileInfo  
)
```

```
C++  
public:  
virtual void DeleteFile(  
    FileInfo^ fileInfo  
)
```

```
F#  
abstract DeleteFile :  
    fileInfo : FileInfo -> unit  
override DeleteFile :  
    fileInfo : FileInfo -> unit
```

Parameters

fileInfo

Type: [System.IO.FileInfo](#)

info about file to delete

See Also

[SessionBase Class](#)

SessionBase.DeleteLocation Method

Deletes a [DatabaseLocation](#), location must first not have any Databases in it

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void DeleteLocation(  
    DatabaseLocation location,  
    bool catalogOnly = false  
)
```

VB

```
Public Overridable Sub DeleteLocation (  
    location As DatabaseLocation,  
    Optional catalogOnly As Boolean = false  
)
```

C++

```
public:  
virtual void DeleteLocation(  
    DatabaseLocation^ location,  
    bool catalogOnly = false  
)
```

F#

```
abstract DeleteLocation :  
    location : DatabaseLocation *  
    ?catalogOnly : bool  
(* Defaults:  
    let_catalogOnly = defaultArg catalogOnly false  
*)  
-> unit  
override DeleteLocation :  
    location : DatabaseLocation *  
    ?catalogOnly : bool  
(* Defaults:  
    let_catalogOnly = defaultArg catalogOnly false  
*)  
-> unit
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The DatabaseLocation to delete

catalogOnly (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Of true, only delete catalog entry. Leave the directory as is.

SessionBase.DeleteObject Method

A way to delete an object without requiring that the object be opened first

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void DeleteObject (  
    ulong id  
)
```

VB

```
Public Sub DeleteObject (  
    id As ULong  
)
```

C++

```
public:  
void DeleteObject (  
    unsigned long long id  
)
```

F#

```
member DeleteObject :  
    id : uint64 -> unit
```

Parameters

id

Type: [System.UInt64](#)

The Id of the object to delete

SessionBase.DeletePage Method

Deletes a page from a database. (part of database Sync beta version - not yet fully designed and tested)
Used by SyncWith when syncing databases with another replica of the current databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void DeletePage(  
    Database db,  
    Page page  
)
```

VB

```
Public Sub DeletePage (  
    db As Database,  
    page As Page  
)
```

C++

```
public:  
void DeletePage(  
    Database^ db,  
    Page^ page  
)
```

F#

```
member DeletePage :  
    db : Database *  
    page : Page -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

Database containing page to delete

page

Type: [VelocityDb.Page](#)

Page to delete

F#

```
abstract FileOpen :  
    db : Database *  
    fileAccess : FileAccess *  
    errorMessage : string byref *  
    ?fileMode : FileMode *  
    ?exclusiveAccess : bool *
```

```
        ?waitOverride : int *
        ?signalError : bool
(* Defaults:
    let_fileMode = defaultArg fileMode FileMode.Open
    let_exclusiveAccess = defaultArg exclusiveAccess false
    let_waitOverride = defaultArg waitOverride -1
    let_signalError = defaultArg signalError true
*)
-> Stream
override FileOpen :
    db : Database *
    fileAccess : FileAccess *
    errorMessage : string byref *
    ?fileMode : FileMode *
    ?exclusiveAccess : bool *
    ?waitOverride : int *
    ?signalError : bool
(* Defaults:
    let_fileMode = defaultArg fileMode FileMode.Open
    let_exclusiveAccess = defaultArg exclusiveAccess false
    let_waitOverride = defaultArg waitOverride -1
    let_signalError = defaultArg signalError true
*)
-> Stream
```

Parameters

db

Type: [VelocityDb.Database](#)
[Database](#)

for which we want to open [Stream](#)

fileAccess

Type: [System.IO.FileAccess](#)
Opening for read or update?

errorMessage

Type: [System.String](#)
Used for passing error messages back to caller

fileMode (Optional)

Type: [System.IO.FileMode](#)
[FileMode](#)

used for opening file

exclusiveAccess (Optional)

Type: [System.Boolean](#)
Do we want exclusive access to file?

waitOverride (Optional)

Type: [System.Int32](#)

VelocityDB Class Library

How long are we willing to wait for a file lock to clear?

signalError (Optional)

Type: [System.Boolean](#)

Throw exception if we can't open file within wait time?

Return Value

Type: [Stream](#)

A [Stream](#) used for accessing [Database](#) data

See Also

[SessionBase Class](#)

[FileOpen Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.FileOpen Method (FileInfo, FileAccess, String, FileShare, FileMode, Int32, Boolean, Boolean)

For internal use.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual Stream FileOpen(  
    FileInfo fileInfo,  
    FileAccess fileAccess,  
    ref string errorMessage,  
    FileShare fileShare,  
    FileMode fileMode,  
    int waitForLockMilliseconds,  
    bool useExternalStorage,  
    bool signalError = true  
)
```

VB

```
Public Overridable Function FileOpen (  
    fileInfo As FileInfo,  
    fileAccess As FileAccess,  
    ByRef errorMessage As String,  
    fileShare As FileShare,  
    fileMode As FileMode,  
    waitForLockMilliseconds As Integer,  
    useExternalStorage As Boolean,  
    Optional signalError As Boolean = true  
) As Stream
```

C++

```
public:  
virtual Stream^ FileOpen(  
    FileInfo^ fileInfo,  
    FileAccess fileAccess,  
    String^% errorMessage,  
    FileShare fileShare,  
    FileMode fileMode,  
    int waitForLockMilliseconds,  
    bool useExternalStorage,  
    bool signalError = true  
)
```

F#

```
abstract FileOpen :  
    fileInfo : FileInfo *  
    fileAccess : FileAccess *
```

```
        errorMessage : string byref *
        fileShare : FileShare *
        fileMode : FileMode *
        waitForLockMilliseconds : int *
        useExternalStorage : bool *
        ?signalError : bool
(* Defaults:
    let _signalError = defaultArg signalError true
*)
-> Stream
override FileOpen :
    fileInfo : FileInfo *
    fileAccess : FileAccess *
    errorMessage : string byref *
    fileShare : FileShare *
    fileMode : FileMode *
    waitForLockMilliseconds : int *
    useExternalStorage : bool *
    ?signalError : bool
(* Defaults:
    let _signalError = defaultArg signalError true
*)
-> Stream
```

Parameters

fileInfo

Type: [System.IO.FileInfo](#)

Info about file to open

fileAccess

Type: [System.IO.FileAccess](#)

Option for file access

errorMessage

Type: [System.String](#)

Error messages stored in this string

fileShare

Type: [System.IO.FileShare](#)

Option for file share

fileMode

Type: [System.IO.FileMode](#)

Option for file mode

waitForLockMilliseconds

Type: [System.Int32](#)

How long to wait for file to become available for open

useExternalStorage

Type: [System.Boolean](#)

VelocityDB Class Library

Parameter used for WindowsPhone API for accessing memory cards

signalError (Optional)

Type: [System.Boolean](#)

If true, signal error if we fail to open file; otherwise ignore errors and return null

Return Value

Type: [Stream](#)

File stream of opened file

[SessionBase Class](#)

[FileOpen Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.FirstFreePage Method

Gets the page number of the first unallocated page in the specified Database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ushort FirstFreePage(  
    Database db,  
    ushort pageNumber  
)
```

VB

```
Public Overridable Function FirstFreePage (  
    db As Database,  
    pageNumber As UShort  
) As UShort
```

C++

```
public:  
virtual unsigned short FirstFreePage(  
    Database^ db,  
    unsigned short pageNumber  
)
```

F#

```
abstract FirstFreePage :  
    db : Database *  
    pageNumber : uint16 -> uint16  
override FirstFreePage :  
    db : Database *  
    pageNumber : uint16 -> uint16
```

Parameters

db

Type: [VelocityDb.Database](#)

The database to query

pageNumber

Type: [System.UInt16](#)

The page number to start search from

Return Value

Type: [UInt16](#)

The first available page number.

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.FlushPageOf Method

By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void FlushPageOf(  
    OptimizedPersistable pObj  
)
```

VB

```
Public Overridable Sub FlushPageOf (  
    pObj As OptimizedPersistable  
)
```

C++

```
public:  
virtual void FlushPageOf(  
    OptimizedPersistable^ pObj  
)
```

F#

```
abstract FlushPageOf :  
    pObj : OptimizedPersistable -> unit  
override FlushPageOf :  
    pObj : OptimizedPersistable -> unit
```

Parameters

pObj

Type: [VelocityDb.OptimizedPersistable](#)

An object indicating what [Page](#) to flush

SessionBase.FlushUpdates Method (Database)

Write any updated/new pages for a specific Database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void FlushUpdates (  
    Database db  
)
```

VB

```
Public Sub FlushUpdates (  
    db As Database  
)
```

C++

```
public:  
void FlushUpdates (  
    Database^ db  
)
```

F#

```
member FlushUpdates :  
    db : Database -> unit
```

Parameters

db

Type: [VelocityDb.Database](#)

The database for which we want to write all updated pages

[VelocityDb.Session Namespace](#)

SessionBase.GetEnumerator Method

Enumerates all open databases for this session

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable<Database> GetEnumerator ()
```

VB

```
Public Function GetEnumerator As IEnumerable(Of Database)
```

C++

```
public:  
virtual IEnumerable<Database^> GetEnumerator () sealed
```

F#

```
abstract GetEnumerator : unit -> IEnumerable<Database>  
override GetEnumerator : unit -> IEnumerable<Database>
```

Return Value

Type: [IEnumerable\(Database\)](#)

Enumeration of open databases

Implements

[IEnumerable\(T\).GetEnumerator\(\)](#)

See Also

[VelocityDb.Session Namespace](#)

SessionBase.GetVersion Method

Gets the version of [Database 0](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong GetVersion()
```

VB

```
Public Function GetVersion As ULong
```

C++

```
public:  
unsigned long long GetVersion()
```

F#

```
member GetVersion : unit -> uint64
```

Return Value

Type: [UInt64](#)

Database 0 version

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.GlobalObjWrapperGet Method

Lookup wrapper object for a non IOptimizedPersistable object

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool GlobalObjWrapperGet (  
    Object lookupObj,  
    out IOptimizedPersistable pObj  
)
```

VB

```
Public Overridable Function GlobalObjWrapperGet (  
    lookupObj As Object,  
    <OutAttribute> ByRef pObj As IOptimizedPersistable  
) As Boolean
```

C++

```
public:  
virtual bool GlobalObjWrapperGet (  
    Object^ lookupObj,  
    [OutAttribute] IOptimizedPersistable^% pObj  
)
```

F#

```
abstract GlobalObjWrapperGet :  
    lookupObj : Object *  
    pObj : IOptimizedPersistable byref -> bool  
override GlobalObjWrapperGet :  
    lookupObj : Object *  
    pObj : IOptimizedPersistable byref -> bool
```

Parameters

lookupObj

Type: [System.Object](#)

object to look for

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

wrapper object

Return Value

Type: [Boolean](#)

Wrapper object

VelocityDB Class Library

SessionBase.HighestInUseLocalDatabaseNumber Method

Figure out what the highest in use database number is on the local host and return it.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint HighestInUseLocalDatabaseNumber ()
```

VB

```
Public Function HighestInUseLocalDatabaseNumber As UInteger
```

C++

```
public:  
unsigned int HighestInUseLocalDatabaseNumber ()
```

F#

```
member HighestInUseLocalDatabaseNumber : unit -> uint32
```

Return Value

Type: [UInt32](#)

The currently largest Database Id in use reachable from this session located on localhost

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.IdOf Method

Finds the object id of a persistent object

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong IdOf(  
    Object obj  
)
```

VB

```
Public Function IdOf (  
    obj As Object  
) As ULong
```

C++

```
public:  
unsigned long long IdOf(  
    Object^ obj  
)
```

F#

```
member IdOf :  
    obj : Object -> uint64
```

Parameters

obj

Type: [System.Object](#)

The object to find the id for

Return Value

Type: [UInt64](#)

The object id or 0 if object was not found

SessionBase.Index(*T*) Method

Gets an index of all objects of a certain type

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public BTreeSet<T> Index<T>()
```

VB

```
Public Function Index(Of T) As BTreeSet(Of T)
```

C++

```
public:  
generic<typename T>  
BTreeSet<T>^ Index()
```

F#

```
member Index : unit -> BTreeSet<'T>
```

Type Parameters

T

The type of object indexed

Return Value

Type: [BTreeSet\(*T*\)](#)

The index

See Also

[SessionBase Class](#)

[Index Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.Index(*T*) Method (String)

Gets an index of all objects of a certain type

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public BTreeSet<T> Index<T>(
    string indexedByFieldName
)
```

VB

```
Public Function Index(Of T) (
    indexedByFieldName As String
) As BTreeSet(Of T)
```

C++

```
public:
generic<typename T>
BTreeSet<T>^ Index(
    String^ indexedByFieldName
)
```

F#

```
member Index :
    indexedByFieldName : string -> BTreeSet<'T>
```

Parameters

indexedByFieldName

Type: [System.String](#)

The field used for sorting the indexed objects

Type Parameters

T

The type of object indexed

Return Value

Type: [BTreeSet\(T\)](#)

The index

See Also

)
```

F#

```
member Index :
    indexedByFieldName : string *
    inDatabase : Database -> BTreeSetOidShort<'T>
```

Parameters

indexedByFieldName

Type: [System.String](#)

The field used for sorting the indexed objects

inDatabase

Type: [VelocityDb.Database](#)

Database containing index

Type Parameters

T

The type of object indexed

VelocityDB Class Library

Return Value

Type: [BTreeSetOidShort\(T\)](#)

The index

See Also

SessionBase.InUseNumberOfPages Method

Gets the number of pages currently in use by a Database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ushort InUseNumberOfPages (
    Database db
)
```

VB

```
Public Overridable Function InUseNumberOfPages (
    db As Database
) As UShort
```

C++

```
public:
virtual unsigned short InUseNumberOfPages (
    Database^ db
)
```

F#

```
abstract InUseNumberOfPages :
    db : Database -> uint16
override InUseNumberOfPages :
    db : Database -> uint16
```

Parameters

db

Type: [VelocityDb.Database](#)

The Database to request info about

Return Value

Type: [UInt16](#)

The number of pages currently in use

SessionBase.IsSameHost Method

Determine if two host names represent the same tcp/ip host

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool IsSameHost(  
    string host1,  
    string host2  
)
```

VB

```
Public Shared Function IsSameHost (  
    host1 As String,  
    host2 As String  
) As Boolean
```

C++

```
public:  
static bool IsSameHost(  
    String^ host1,  
    String^ host2  
)
```

F#

```
static member IsSameHost :  
    host1 : string *  
    host2 : string -> bool
```

Parameters

host1

Type: [System.String](#)

Host name 1

host2

Type: [System.String](#)

Host name 2

Return Value

Type: [Boolean](#)

True if host is the same; otherwise false

SessionBase.LoadFields Method

Loads all field values of an object if they are not already loaded.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void LoadFields(  
    IOptimizedPersistable pObj,  
    int depth = 2147483647  
)
```

VB

```
Public Sub LoadFields (  
    pObj As IOptimizedPersistable,  
    Optional depth As Integer = 2147483647  
)
```

C++

```
public:  
void LoadFields(  
    IOptimizedPersistable^ pObj,  
    int depth = 2147483647  
)
```

F#

```
member LoadFields :  
    pObj : IOptimizedPersistable *  
    ?depth : int  
(* Defaults:  
    let _depth = defaultArg depth 2147483647  
)  
-> unit
```

Parameters

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

Persistent object for which to load field values.

depth (Optional)

Type: [System.Int32](#)

Set this if you want to limit the depth of the graph loaded by this open.

    uint megaBytesPresize = 0,
    string name = null,
    bool signalError = true
)
```

VB

```
Public Overridable Function NewDatabase (
    dbNum As UInteger,
    Optional megaBytesPresize As UInteger = 0,
    Optional name As String = Nothing,
    Optional signalError As Boolean = true
) As Database
```

C++

```
public:
virtual Database^ NewDatabase(
    unsigned int dbNum,
    unsigned int megaBytesPresize = 0,
    String^ name = nullptr,
    bool signalError = true
)
```

F#

```
abstract NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
    let_megaBytesPresize = defaultArg megaBytesPresize 0
    let_name = defaultArg name null
    let_signalError = defaultArg signalError true
*)
-> Database
override NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
```

VelocityDB Class Library

```
        let_megaBytesPresize = defaultArg megaBytesPresize 0
        let_name = defaultArg name null
        let_signalError = defaultArg signalError true
    *)
    -> Database
```

Parameters

dbNum

Type: [System.UInt32](#)

Database number of the database to create

megaBytesPresize (Optional)

Type: [System.UInt32](#)

If you know that the Database will be large, presizing it may avoid file fragmentation. Default value is 0

name (Optional)

Type: [System.String](#)

Optionally name the new [Database](#)

signalError (Optional)

Type: [System.Boolean](#)

Optionally signal an error if creation of new [Database](#) fails

Return Value

Type: [Database](#)

The newly created [Database](#) or throws an exception if the [Database](#) already exist

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.NewLocation Method

Creates a new DatabaseLocation or updates existing ones

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual DatabaseLocation NewLocation(  
    DatabaseLocation location  
)
```

VB

```
Public Overridable Function NewLocation (  
    location As DatabaseLocation  
) As DatabaseLocation
```

C++

```
public:  
virtual DatabaseLocation^ NewLocation(  
    DatabaseLocation^ location  
)
```

F#

```
abstract NewLocation :  
    location : DatabaseLocation -> DatabaseLocation  
override NewLocation :  
    location : DatabaseLocation -> DatabaseLocation
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The input location

Return Value

Type: [DatabaseLocation](#)

The new DatabaseLocation or an existing one

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.Objects(T) Method

Enumerates all the objects of a given type

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public IEnumerable<T> Objects<T>()  
where T : OptimizedPersistable
```

VB

```
Public Function Objects(Of T As OptimizedPersistable) As IEnumerable(Of T)
```

C++

```
public:  
generic<typename T>  
where T : OptimizedPersistable  
IEnumerator<T>^ Objects()
```

F#

```
member Objects : unit -> IEnumerable<'T> when 'T : OptimizedPersistable
```

Type Parameters

T

The type of object we are looking for

Return Value

Type: [IEnumerator\(T\)](#)

An enumeration of type T

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.OfType Method

Gets an object used for enumerating all objects in all Databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public OfType OfType(  
    Type type,  
    bool includeSubclasses = true,  
    bool databasePerType = true  
)
```

VB

```
Public Function OfType (  
    type As Type,  
    Optional includeSubclasses As Boolean = true,  
    Optional databasePerType As Boolean = true  
) As OfType
```

C++

```
public:  
OfType^ OfType(  
    Type^ type,  
    bool includeSubclasses = true,  
    bool databasePerType = true  
)
```

F#

```
member OfType :  
    type : Type *  
    ?includeSubclasses : bool *  
    ?databasePerType : bool  
(* Defaults:  
    let_includeSubclasses = defaultArg includeSubclasses true  
    let_databasePerType = defaultArg databasePerType true  
)  
-> OfType
```

Parameters

type

Type: [System.Type](#)

Type to look for

includeSubclasses (Optional)

Type: [System.Boolean](#)

Also return instances of sub classes or classes that implements the specified interface class

databasePerType (Optional)

Type: [System.Boolean](#)

Assume that persisted objects were made persistent the simple way using [Persist\(IOptimizedPersistable, Nullable\(UInt16\)\)](#). When persisting this way, each object type gets its own [Database](#) which makes finding these objects easier and faster

Return Value

Type: [OfType](#)

The enumeration wrapper **OfType(Type, Boolean, Boolean)**object

[VelocityDb.Session Namespace](#)

SessionBase.OidShortOf Method

Finds the object id of a persistent object

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public uint OidShortOf(  
    Object obj  
)
```

VB

```
Public Function OidShortOf (  
    obj As Object  
) As UInteger
```

C++

```
public:  
unsigned int OidShortOf(  
    Object^ obj  
)
```

F#

```
member OidShortOf :  
    obj : Object -> uint32
```

Parameters

obj

Type: [System.Object](#)

The object to find the id for

Return Value

Type: [UInt32](#)

The object id or 0 if object was not found

Open all databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual List<Database> OpenAllDatabases (  
    bool update = false  
)
```

VB

```
Public Overridable Function OpenAllDatabases (  
    Optional update As Boolean = false  
) As List(Of Database)
```

C++

```
public:  
virtual List<Database^>^ OpenAllDatabases (  
    bool update = false  
)
```

F#

```
abstract OpenAllDatabases :  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
*)  
-> List<Database>  
override OpenAllDatabases :  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
*)  
-> List<Database>
```

Parameters

update (Optional)

Type: [System.Boolean](#)

Open for update?

Return Value

Type: [List\(Database\)](#)

List of [Database](#)

See Also

    unsigned int dbNum,
    bool update = false,
    bool signalError = true
)
```

F#

```
abstract OpenDatabase :
    dbNum : uint32 *
    ?update : bool *
    ?signalError : bool
(* Defaults:
    let_update = defaultArg update false
    let_signalError = defaultArg signalError true
*)
-> Database
override OpenDatabase :
    dbNum : uint32 *
    ?update : bool *
    ?signalError : bool
(* Defaults:
    let_update = defaultArg update false
    let_signalError = defaultArg signalError true
*)
-> Database
```

VelocityDB Class Library

Parameters

dbNum

Type: [System.UInt32](#)

The Database number of the database to open

update (Optional)

Type: [System.Boolean](#)

Open the Database for update?

signalError (Optional)

Type: [System.Boolean](#)

Signal errors if errors found when opening the Database?

Return Value

Type: [Database](#)

The opened Database

override OpenLocationDatabases :  
    location : DatabaseLocation *  
    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
*)  
-> List<Database>
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The location for which to open databases

update (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Shall each database be opened for update?

Return Value

Type: [List\(Database\)](#)

A list of opened databases

SessionBase.OpenPage Method

Opens a page for read, used by DatabaseManager for page browsing

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Page OpenPage(  
    Database db,  
    ushort pageNumber,  
    bool stubOnly = false  
)
```

VB

```
Public Function OpenPage (  
    db As Database,  
    pageNumber As UShort,  
    Optional stubOnly As Boolean = false  
) As Page
```

C++

```
public:  
Page^ OpenPage(  
    Database^ db,  
    unsigned short pageNumber,  
    bool stubOnly = false  
)
```

F#

```
member OpenPage :  
    db : Database *  
    pageNumber : uint16 *  
    ?stubOnly : bool  
(* Defaults:  
    let_stubOnly = defaultArg stubOnly false  
)  
-> Page
```

Parameters

db

Type: [VelocityDb.Database](#)

Database containing the requested page

pageNumber

Type: [System.UInt16](#)

Page number of the requested page

VelocityDB Class Library

stubOnly (Optional)

Type: [System.Boolean](#)

Open page but don't retrieve slot bytes? (lazy load)

Return Value

Type: [Page](#)

The requested page

SessionBase.ParseCsvRow Method

Parses a row in a csv file and returns an iterator of column string values

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static IEnumerable<string> ParseCsvRow(  
    string r  
)
```

VB

```
Public Shared Function ParseCsvRow (  
    r As String  
) As IEnumerable(Of String)
```

C++

```
public:  
static IEnumerable<String^>^ ParseCsvRow(  
    String^ r  
)
```

F#

```
static member ParseCsvRow :  
    r : string -> IEnumerable<string>
```

Parameters

r

Type: [System.String](#)

Csv row string data to be parsed

Return Value

Type: [IEnumerable\(String\)](#)

Iterator of column values

SessionBase.Persist Method (Object)

This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong Persist(  
    Object obj  
)
```

VB

```
Public Function Persist (  
    obj As Object  
) As ULong
```

C++

```
public:  
unsigned long long Persist(  
    Object^ obj  
)
```

F#

```
member Persist :  
    obj : Object -> uint64
```

Parameters

obj

Type: [System.Object](#)

The object to make persistent

Return Value

Type: [UInt64](#)

The Id of the persisted object

See Also

[SessionBase Class](#)

[Persist Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.Persist Method (IOptimizedPersistable, Nullable(UInt16))

This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides [PlacementDatabaseNumber](#) and returns something other than [DefaultPlacementDatabaseNumber](#).

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual ulong Persist (
    IOptimizedPersistable ipObj,
    ushort? objectsPerPage = null
)
```

VB

```
Public Overridable Function Persist (
    ipObj As IOptimizedPersistable,
    Optional objectsPerPage As UShort? = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    IOptimizedPersistable^ ipObj,
    Nullable<unsigned short> objectsPerPage = nullptr
)
```

F#

```
abstract Persist :
    ipObj : IOptimizedPersistable *
    ?objectsPerPage : Nullable<uint16>
(* Defaults:
    let_objectsPerPage = defaultArg objectsPerPage null
*)
-> uint64
override Persist :
    ipObj : IOptimizedPersistable *
    ?objectsPerPage : Nullable<uint16>
(* Defaults:
    let_objectsPerPage = defaultArg objectsPerPage null
*)
-> uint64
```

Parameters

ipObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to make persistent

VelocityDB Class Library

objectsPerPage (Optional)

Type: [System.Nullable\(UInt16\)](#)

Override of objects per page, only respected when persisting first object of some type

Return Value

Type: [UInt64](#)

The Id of the persisted object

See Also

    IOptimizedPersistable^ obj  
)
```

F#

```
member Persist :  
    place : Placement *  
    obj : IOptimizedPersistable -> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

Provides placement guidance

obj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to persist

Return Value

Type: [UInt64](#)

The Id of the persistent object

See Also

    parent As IOptimizedPersistable,  
    Optional inFlush As Boolean = false  
) As ULong
```

C++

```
public:  
unsigned long long Persist(  
    Object^ obj,  
    IOptimizedPersistable^ parent,  
    bool inFlush = false  
)
```

F#

```
member Persist :  
    obj : Object *  
    parent : IOptimizedPersistable *  
    ?inFlush : bool  
(* Defaults:  
    let_inFlush = defaultArg inFlush false  
)  
-> uint64
```

Parameters

obj

Type: [System.Object](#)

The object to persist.

parent

Type: [VelocityDb.IOptimizedPersistable](#)

A parent object of the object to persist.

VelocityDB Class Library

inFlush (Optional)

Type: [System.Boolean](#)

If true, disallow page flushing

Return Value

Type: [UInt64](#)

The Id of the persisted object.

    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let _slotLimitPerPage = defaultArg slotLimitPerPage 0
```

```
        let_inFlush = defaultArg inFlush false
        let_toPersist = defaultArg toPersist null
*)
-> uint64
override Persist :
    place : Placement *
    pObj : IOptimizedPersistable *
    schema : Schema *
    ?slotLimitPerPage : uint16 *
    ?inFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_slotLimitPerPage = defaultArg slotLimitPerPage 0
    let_inFlush = defaultArg inFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

Placement object determining where to persist the object

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to persist

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active session schema

slotLimitPerPage (Optional)

Type: [System.UInt16](#)

Override of how many slots per page to permit

inFlush (Optional)

Type: [System.Boolean](#)

Set to true to disallow page flushes as a side affect

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A list of objects waiting to be persisted

Return Value

Type: [UInt64](#)

Id of persisted object

Call this function if you may have updated many pages to possibly free up memory if too much memory is in use.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void PossiblyFlushUpdatedPages (  
    uint numberOfUpdatedPagesPermittedWithoutFlushCheck = 100  
)
```

VB

```
Public Overridable Sub PossiblyFlushUpdatedPages (  
    Optional numberOfUpdatedPagesPermittedWithoutFlushCheck As UInteger =  
100  
)
```

C++

```
public:  
virtual void PossiblyFlushUpdatedPages (  
    unsigned int numberOfUpdatedPagesPermittedWithoutFlushCheck = 100  
)
```

F#

```
abstract PossiblyFlushUpdatedPages :  
    ?numberOfUpdatedPagesPermittedWithoutFlushCheck : uint32  
(* Defaults:  
    let numberOfUpdatedPagesPermittedWithoutFlushCheck = defaultArg  
numberOfUpdatedPagesPermittedWithoutFlushCheck 100  
)  
-> unit  
override PossiblyFlushUpdatedPages :  
    ?numberOfUpdatedPagesPermittedWithoutFlushCheck : uint32  
(* Defaults:  
    let numberOfUpdatedPagesPermittedWithoutFlushCheck = defaultArg  
numberOfUpdatedPagesPermittedWithoutFlushCheck 100  
)  
-> unit
```

Parameters

numberOfUpdatedPagesPermittedWithoutFlushCheck (Optional)

Type: [System.UInt32](#)

Only do check if the number of updated pages is greater than this number

SessionBase.RegisterClass Method

Register a class in the persistent schema. It is a good idea to do this explicitly instead of having it happen the first time an object of an unregistered class is made persistent

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion RegisterClass(  
    Type type  
)
```

VB

```
Public Function RegisterClass (  
    type As Type  
) As TypeVersion
```

C++

```
public:  
TypeVersion^ RegisterClass(  
    Type^ type  
)
```

F#

```
member RegisterClass :  
    type : Type -> TypeVersion
```

Parameters

type

Type: [System.Type](#)

The type to register in the persistent schema

Return Value

Type: [TypeVersion](#)

[TypeVersion](#) corresponding to type registered

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.RelocateDatabaseLocationFor Method

After moving/copying directory containing your [Database](#) with id *dbId* call this before starting a transaction to update host and directory of the associated [DatabaseLocation](#). This function does not move the database files, it only updates the [DatabaseLocation](#).

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DatabaseLocation RelocateDatabaseLocationFor (
    uint dbId,
    string hostName,
    string directory
)
```

VB

```
Public Function RelocateDatabaseLocationFor (
    dbId As UInteger,
    hostName As String,
    directory As String
) As DatabaseLocation
```

C++

```
public:
DatabaseLocation^ RelocateDatabaseLocationFor(
    unsigned int dbId,
    String^ hostName,
    String^ directory
)
```

F#

```
member RelocateDatabaseLocationFor :
    dbId : uint32 *
    hostName : string *
    directory : string -> DatabaseLocation
```

Parameters

dbId

Type: [System.UInt32](#)

Id of one of the [Databases](#) in location being relocated

hostName

Type: [System.String](#)

New host name

directory

VelocityDB Class Library

Type: [System.String](#)

New directory path

Return Value

Type: [DatabaseLocation](#)

Updated [DatabaseLocation](#)

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.RelocateDefaultDatabaseLocation Method

After moving/copying directory containing your [Databases](#) 0.odb, 1.odb ... call this before starting a transaction to update host and directory of the default [DatabaseLocation](#). This function does not move the database files, it only updates the [DatabaseLocation](#).

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public DatabaseLocation RelocateDefaultDatabaseLocation ()
```

VB

```
Public Function RelocateDefaultDatabaseLocation As DatabaseLocation
```

C++

```
public:  
DatabaseLocation^ RelocateDefaultDatabaseLocation ()
```

F#

```
member RelocateDefaultDatabaseLocation : unit -> DatabaseLocation
```

Return Value

Type: [DatabaseLocation](#)

The default [DatabaseLocation](#)

SessionBase.ReplacePage Method

Only to be used in VelocityDbExtensions while syncing databases

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void ReplacePage(  
    Database databaseToUpdate,  
    Page pageToUpdate,  
    Page pageToRead  
)
```

VB

```
Public Overridable Sub ReplacePage (  
    databaseToUpdate As Database,  
    pageToUpdate As Page,  
    pageToRead As Page  
)
```

C++

```
public:  
virtual void ReplacePage(  
    Database^ databaseToUpdate,  
    Page^ pageToUpdate,  
    Page^ pageToRead  
)
```

F#

```
abstract ReplacePage :  
    databaseToUpdate : Database *  
    pageToUpdate : Page *  
    pageToRead : Page -> unit  
override ReplacePage :  
    databaseToUpdate : Database *  
    pageToUpdate : Page *  
    pageToRead : Page -> unit
```

Parameters

databaseToUpdate

Type: [VelocityDb.Database](#)

Database being synced

pageToUpdate

Type: [VelocityDb.Page](#)

Page to sync

VelocityDB Class Library

pageToRead

Type: [VelocityDb.Page](#)

Page to sync from

SessionBase.ReplacePersistedType Method (String, Type)

Updates the [Type](#) associated with a [VelocityDbType](#). This can be used when you want to rename a class or move a class to a different namespace. You will need to have the prior [Type](#) loaded as it is defined in the current [Schema](#) for this to work. Once the update has been done, you should no longer need to keep the old [Type](#) loaded. Be sure to backup all your data before doing this.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool ReplacePersistedType (
    string oldTypeFullAssemblyName,
    Type newType
)
```

VB

```
Public Function ReplacePersistedType (
    oldTypeFullAssemblyName As String,
    newType As Type
) As Boolean
```

C++

```
public:
bool ReplacePersistedType (
    String^ oldTypeFullAssemblyName,
    Type^ newType
)
```

F#

```
member ReplacePersistedType :
    oldTypeFullAssemblyName : string *
    newType : Type -> bool
```

Parameters

oldTypeFullAssemblyName

Type: [System.String](#)

The assembly qualified name of the [Type](#) currently used within the [Schema](#)

newType

Type: [System.Type](#)

The [Type](#) you want to replace with in the [Schema](#). This new [Type](#) must NOT already be part of the schema.

VelocityDB Class Library

Return Value

Type: [Boolean](#)

true if old type name was found; otherwise false

SessionBase.ReplacePersistedType Method (Type, Type)

Updates the [Type](#) associated with a [VelocityDbType](#). This can be used when you want to rename a class or move a class to a different namespace. You will need to have the prior [Type](#) loaded as it is defined in the current [Schema](#) for this to work. Once the update has been done, you should no longer need to keep the old [Type](#) loaded. Be sure to backup all your data before doing this.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void ReplacePersistedType (  
    Type oldType,  
    Type newType  
)
```

VB

```
Public Sub ReplacePersistedType (  
    oldType As Type,  
    newType As Type  
)
```

C++

```
public:  
void ReplacePersistedType (  
    Type^ oldType,  
    Type^ newType  
)
```

F#

```
member ReplacePersistedType :  
    oldType : Type *  
    newType : Type -> unit
```

Parameters

oldType

Type: [System.Type](#)

The [Type](#) currently used within the [Schema](#)

newType

Type: [System.Type](#)

The [Type](#) you want to replace with in the [Schema](#). This new [Type](#) must NOT already be part of the schema.

SessionBase.RestoreFrom Method (DatabaseLocation, DateTime)

Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void RestoreFrom(  
    DatabaseLocation backupLocation,  
    DateTime upToTime  
)
```

VB

```
Public Overridable Sub RestoreFrom (  
    backupLocation As DatabaseLocation,  
    upToTime As DateTime  
)
```

C++

```
public:  
virtual void RestoreFrom(  
    DatabaseLocation^ backupLocation,  
    DateTime upToTime  
)
```

F#

```
abstract RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit  
override RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit
```

Parameters

backupLocation

Type: [VelocityDb.DatabaseLocation](#)

The location to restore from

upToTime

Type: [System.DateTime](#)

Restore location up to a given DateTime. Data backed up after this time will not be restored.

[VelocityDb.Session Namespace](#)

SessionBase.RestoreFrom Method (String, String, UInt32, DateTime)

Restores a [DatabaseLocation](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void RestoreFrom(  
    string host,  
    string path,  
    uint backupDbNum,  
    DateTime upToTime  
)
```

VB

```
Public Overridable Sub RestoreFrom (  
    host As String,  
    path As String,  
    backupDbNum As UInteger,  
    upToTime As DateTime  
)
```

C++

```
public:  
virtual void RestoreFrom(  
    String^ host,  
    String^ path,  
    unsigned int backupDbNum,  
    DateTime upToTime  
)
```

F#

```
abstract RestoreFrom :  
    host : string *  
    path : string *  
    backupDbNum : uint32 *  
    upToTime : DateTime -> unit  
override RestoreFrom :  
    host : string *  
    path : string *  
    backupDbNum : uint32 *  
    upToTime : DateTime -> unit
```

Parameters

host

Type: [System.String](#)

Host name of backup

VelocityDB Class Library

path

Type: [System.String](#)

Directory path to backup

backupDbNum

Type: [System.UInt32](#)

Initial database number used by backup [DatabaseLocation](#)

upToTime

Type: [System.DateTime](#)

Restore data up to this time

[VelocityDb.Session Namespace](#)

SessionBase.SetMinMaxStringIntern Method

A persistent string read into memory from a [Database](#) is interned using [Intern\(String\)](#) to speed up comparisons and conserve memory (when the same string occurs in many places)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static void SetMinMaxStringIntern(  
    ushort minSize,  
    ushort maxSize  
)
```

VB

```
Public Shared Sub SetMinMaxStringIntern (  
    minSize As UShort,  
    maxSize As UShort  
)
```

C++

```
public:  
static void SetMinMaxStringIntern(  
    unsigned short minSize,  
    unsigned short maxSize  
)
```

F#

```
static member SetMinMaxStringIntern :  
    minSize : uint16 *  
    maxSize : uint16 -> unit
```

Parameters

minSize

Type: [System.UInt16](#)

Selected minimum plus one string length of a string to be interned

maxSize

Type: [System.UInt16](#)

Selected maximum string length for a string to be interned

SessionBase.SetTraceAllDbActivity Method

Enable some Trace output about persistent events related to all databases and pages. Add a Trace listener to get to Console window: `Trace.Listeners.Add(new ConsoleTraceListener());`

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SetTraceAllDbActivity(  
    bool enable = true  
)
```

VB

```
Public Sub SetTraceAllDbActivity (  
    Optional enable As Boolean = true  
)
```

C++

```
public:  
void SetTraceAllDbActivity(  
    bool enable = true  
)
```

F#

```
member SetTraceAllDbActivity :  
    ?enable : bool  
(* Defaults:  
    let _enable = defaultArg enable true  
*)  
-> unit
```

Parameters

enable (Optional)

Type: [System.Boolean](#)

See Also

[SessionBase Class](#)

SessionBase.SetTraceDbActivity Method

Enable some Trace output about persistent events related to a Database. Add a Trace listener to get to Console window: `Trace.Listeners.Add(new ConsoleTraceListener());`

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SetTraceDbActivity(  
    uint dbId  
)
```

VB

```
Public Sub SetTraceDbActivity (  
    dbId As UInteger  
)
```

C++

```
public:  
void SetTraceDbActivity(  
    unsigned int dbId  
)
```

F#

```
member SetTraceDbActivity :  
    dbId : uint32 -> unit
```

Parameters

dbId

Type: [System.UInt32](#)

The Database number of the Database to enable persistent trace information for.

SessionBase.StringToType Method

Gets a [Type](#) given a string representation of a type

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static Type StringToType(  
    string typeAsString  
)
```

VB

```
Public Shared Function StringToType (  
    typeAsString As String  
) As Type
```

C++

```
public:  
static Type^ StringToType(  
    String^ typeAsString  
)
```

F#

```
static member StringToType :  
    typeAsString : string -> Type
```

Parameters

typeAsString

Type: [System.String](#)

The string representation of a [Type](#)

Return Value

Type: [Type](#)

Type from string

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.SubscribeToChanges Method

Subscribe to committed database changes of instances of a type when an optional property evaluates to true.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void SubscribeToChanges (
    Type aType,
    string notifyIfTrueProperty = null
)
```

VB

```
Public Overridable Sub SubscribeToChanges (
    aType As Type,
    Optional notifyIfTrueProperty As String = Nothing
)
```

C++

```
public:
virtual void SubscribeToChanges (
    Type^ aType,
    String^ notifyIfTrueProperty = nullptr
)
```

F#

```
abstract SubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
override SubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
```

Parameters

aType

Type: [System.Type](#)

The type you are interested in being notified about when persistent instances changes within a database.

notifyIfTrueProperty (Optional)

Type: [System.String](#)

The name of a property part of the type specified as aType, this should be a Boolean property. When property returns true, a change notification is send otherwise no notification is send. Leave as null to get a notification any time any instance of the selected type changes

SessionBase.TryDatabase Method

Gets the current database to try

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Database TryDatabase(  
    Placement place  
)
```

VB

```
Public Function TryDatabase (  
    place As Placement  
) As Database
```

C++

```
public:  
Database^ TryDatabase(  
    Placement^ place  
)
```

F#

```
member TryDatabase :  
    place : Placement -> Database
```

Parameters

place

Type: [VelocityDb.Placement](#)

the placement object to retrieve from

Return Value

Type: [Database](#)

A database or null if not cached

See Also

SessionBase.Unpersist Method

Use this when you want to delete objects that are not assignable as [IOptimizedPersistable](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public virtual bool Unpersist(  
    Object obj  
)
```

```
VB  
Public Overridable Function Unpersist (  
    obj As Object  
) As Boolean
```

```
C++  
public:  
virtual bool Unpersist(  
    Object^ obj  
)
```

```
F#  
abstract Unpersist :  
    obj : Object -> bool  
override Unpersist :  
    obj : Object -> bool
```

Parameters

obj

Type: [System.Object](#)

The object to be deleted from persistent storage

Return Value

Type: [Boolean](#)

true if object found and deleted; otherwise false

See Also

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.UnsubscribeToChanges Method

Unsubscribe to committed database changes of instances of a type when an optional property evaluates to true.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual void UnsubscribeToChanges (
    Type aType,
    string notifyIfTrueProperty = null
)
```

VB

```
Public Overridable Sub UnsubscribeToChanges (
    aType As Type,
    Optional notifyIfTrueProperty As String = Nothing
)
```

C++

```
public:
virtual void UnsubscribeToChanges (
    Type^ aType,
    String^ notifyIfTrueProperty = nullptr
)
```

F#

```
abstract UnsubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
override UnsubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
```

Parameters

aType

Type: [System.Type](#)

The type you are no longer interested in being notified about when persistent instances changes within a database.

VelocityDB Class Library

notifyIfTrueProperty (Optional)

Type: [System.String](#)

The name of a property part of the type specified as aType, this should be a Boolean property.

See Also

[VelocityDb.Session Namespace](#)

SessionBase.UpdateClass Method

Let VelocityDB know that changes have been made to a class so that the schema manager will create a new [TypeVersion](#) and use the new version for all new objects of the specified Type.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion UpdateClass(  
    Type type  
)
```

VB

```
Public Function UpdateClass (  
    type As Type  
) As TypeVersion
```

C++

```
public:  
TypeVersion^ UpdateClass(  
    Type^ type  
)
```

F#

```
member UpdateClass :  
    type : Type -> TypeVersion
```

Parameters

type

Type: [System.Type](#)

The type that has been updated (new/removed/modified fields)

Return Value

Type: [TypeVersion](#)

The new Type description

See Also

[SessionBase Class](#)

SessionBase.UpdateDatabase Method

Request an update lock on a database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public virtual bool UpdateDatabase(  
    Database db  
)
```

```
VB  
Public Overridable Function UpdateDatabase (  
    db As Database  
) As Boolean
```

```
C++  
public:  
virtual bool UpdateDatabase(  
    Database^ db  
)
```

```
F#  
abstract UpdateDatabase :  
    db : Database -> bool  
override UpdateDatabase :  
    db : Database -> bool
```

Parameters

db

Type: [VelocityDb.Database](#)

The database to update

Return Value

Type: [Boolean](#)

true if Database was updated, otherwise throws an exception

```
Public Overridable Function UpdateObject (  
    obj As IOptimizedPersistable  
) As Boolean
```

C++

```
public:  
virtual bool UpdateObject(  
    IOptimizedPersistable^ obj  
)
```

F#

```
abstract UpdateObject :  
    obj : IOptimizedPersistable -> bool  
override UpdateObject :  
    obj : IOptimizedPersistable -> bool
```

Parameters

obj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to update.

Return Value

Type: [Boolean](#)

true if object updated; otherwise false

See Also

[SessionBase Class](#)

[UpdateObject Overload](#)

[VelocityDb.Session Namespace](#)

SessionBase.UpdateObject Method (Object, Action)

Provides a way to update an object in a multi threaded scenario where we must make sure that object page isn't flushed until updates to object are done.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public virtual bool UpdateObject(  
    Object obj,  
    Action codeBlock  
)
```

VB

```
Public Overridable Function UpdateObject (  
    obj As Object,  
    codeBlock As Action  
) As Boolean
```

C++

```
public:  
virtual bool UpdateObject(  
    Object^ obj,  
    Action^ codeBlock  
)
```

F#

```
abstract UpdateObject :  
    obj : Object *  
    codeBlock : Action -> bool  
override UpdateObject :  
    obj : Object *  
    codeBlock : Action -> bool
```

Parameters

obj

Type: [System.Object](#)

Object to update

codeBlock

Type: [System.Action](#)

Block of code doing actual update to the object

Return Value

Type: [Boolean](#)

true if object updated; otherwise false

    inFlush : bool *
    ?deleteObjFromIndexes : bool
(* Defaults:
    let _deleteObjFromIndexes = defaultArg deleteObjFromIndexes true
*)
-> bool
```

VelocityDB Class Library

Parameters

obj

Type: [VelocityDb.IOptimizedPersistable](#)

Object to be updated

inFlush

Type: [System.Boolean](#)

Are we doing this as part of a page flush? Set to true to avoid a recursive page flush

deleteObjFromIndexes (Optional)

Type: [System.Boolean](#)

Set to false if you know that this object is not part of any index. Safe to leave set to true in any case

Return Value

Type: [Boolean](#)

True if object is updated; otherwise false

[SessionBase Class](#)

[VelocityDb.Session Namespace](#)

SessionBase.Transaction Class

Helper object to enable automatic rollback/abort of transaction if transaction isn't committed within it's scope.

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Session.SessionBase.Transaction

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class Transaction : IDisposable
```

VB

```
Public Class Transaction  
    Implements IDisposable
```

C++

```
public ref class Transaction : IDisposable
```

F#

```
type Transaction =  
    class  
        interface IDisposable  
    end
```

The SessionBase.Transaction type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------|----------------------------------------------------------------------------------------------------------|
|  | Commit | Commits the active transaction |
|  | Dispose | If in update transaction; rollback (abort) transaction. If in read only transaction; commit transaction. |
|  | Rollback | Aborts the current transaction and rolls it back. Same as Abort() |

[VelocityDBExtensions2.AzureSession](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class SessionNoServer : SessionBase,
    IDisposable
```

VB

```
Public Class SessionNoServer
    Inherits SessionBase
    Implements IDisposable
```

C++

```
public ref class SessionNoServer : public SessionBase,
    IDisposable
```

F#

```
type SessionNoServer =
    class
        inherit SessionBase
        interface IDisposable
    end
```

The **SessionNoServer** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------|-----------------------------------------------------------------------------------------------------------|
|  | SessionNoServer | Creates a new session. For a thread safe version of this class, use SessionNoServerShared |

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AssumeLocalHost | SessionNoServer ignores DatabaseLocation HostName since it cannot connect to a VelocityDbServer. (Overrides SessionBase.AssumeLocalHost .) |

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
|  UpdateDatabase | Request an update lock on a database (Overrides SessionBase.UpdateDatabase(Database) .) |

Extension Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv .) |
|  ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport .) |
|  ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport .) |
|  ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport .) |
|  ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv .) |
|  ImportJson(T) | (Defined by JsonImportExport .) |
|  MicrosoftSync | (Defined by Sync .) |
|  SyncWith(SessionBase) | Overloaded. (Defined by Sync .) |
|  SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync .) |

[VelocityDb.Session Namespace](#)

SessionNoServer Constructor

Creates a new session. For a thread safe version of this class, use [SessionNoServerShared](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SessionNoServer(
    string systemDir,
    int waitForLockMilliseconds = 5000,
    bool optimisticLocking = true,
    bool enablePageCache = true,
    CacheEnum objectCachingDefaultPolicy = CacheEnum.Yes,
    bool enableDatabaseCache = true
)
```

VB

```
Public Sub New (
    systemDir As String,
    Optional waitForLockMilliseconds As Integer = 5000,
    Optional optimisticLocking As Boolean = true,
    Optional enablePageCache As Boolean = true,
    Optional objectCachingDefaultPolicy As CacheEnum = CacheEnum.Yes,
    Optional enableDatabaseCache As Boolean = true
)
```

C++

```
public:
    SessionNoServer(
        String^ systemDir,
        int waitForLockMilliseconds = 5000,
        bool optimisticLocking = true,
        bool enablePageCache = true,
        CacheEnum objectCachingDefaultPolicy = CacheEnum::Yes,
        bool enableDatabaseCache = true
    )
```

F#

```
new :
    systemDir : string *
    ?waitForLockMilliseconds : int *
    ?optimisticLocking : bool *
    ?enablePageCache : bool *
    ?objectCachingDefaultPolicy : CacheEnum *
    ?enableDatabaseCache : bool
(* Defaults:
    let _waitForLockMilliseconds = defaultArg waitForLockMilliseconds 5000
    let _optimisticLocking = defaultArg optimisticLocking true
    let _enablePageCache = defaultArg enablePageCache true
```

```
        let_objectCachingDefaultPolicy = defaultArg
objectCachingDefaultPolicy CacheEnum.Yes
        let_enableDatabaseCache = defaultArg enableDatabaseCache true
*)
-> SessionNoServer
```

Parameters

systemDir

Type: [System.String](#)

The startup location directory path. Path can be an absolute (full) path or a path relative to **s_baseDatabasePath**

waitForLockMilliseconds (Optional)

Type: [System.Int32](#)

The desired maximum lock wait time

optimisticLocking (Optional)

Type: [System.Boolean](#)

Use optimistic locking. With optimistic locking, readers are always permitted and multiple updaters are permitted to update the same Databases/Pages but only the first transaction to commit or flush an updated Database/Page will be successful in making the committed change. Other updaters will get an `OptimisticLockingException` if they try to commit/flush updates to the same Pages/Database. See http://en.wikipedia.org/wiki/Optimistic_concurrency_control for further explanation of optimistic locking. If optimistic locking is not enabled then pessimistic locking is used. See: http://en.wikipedia.org/wiki/Concurrency_control

enablePageCache (Optional)

Type: [System.Boolean](#)

If strong reference page caching isn't desired, turn it off by setting to false

objectCachingDefaultPolicy (Optional)

Type: [VelocityDb.CacheEnum](#)

Determines default value of [Cache](#)

enableDatabaseCache (Optional)

Type: [System.Boolean](#)

Is this session going to enable strong reference [Database](#) caching?

SessionNoServer.SessionNoServer Methods

The [SessionNoServer](#) type exposes the following members.

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
|  UpdateDatabase | Request an update lock on a database (Overrides SessionBase.UpdateDatabase(Database.)) |

Extension Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Oid) | Overloaded. (Defined by JsonImportExport.) |
|  ExportToJson(T)(Boolean, Boolean) | Overloaded. (Defined by JsonImportExport.) |
|  ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV (Defined by ImportExportCsv.) |
|  ImportJson(T) | (Defined by JsonImportExport.) |
|  MicrosoftSync | (Defined by Sync.) |
|  SyncWith(SessionBase) | Overloaded. (Defined by Sync.) |
|  SyncWith(SessionBase, Func(SessionBase, UInt64, Change, Boolean)) | Overloaded. (Defined by Sync.) |

[VelocityDb.Session Namespace](#)

SessionNoServer.UpdateDatabase Method

Request an update lock on a database

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool UpdateDatabase(  
    Database db  
)
```

VB

```
Public Overrides Function UpdateDatabase (  
    db As Database  
) As Boolean
```

C++

```
public:  
virtual bool UpdateDatabase(  
    Database^ db  
) override
```

F#

```
abstract UpdateDatabase :  
    db : Database -> bool  
override UpdateDatabase :  
    db : Database -> bool
```

Parameters

db

Type: [VelocityDb.Database](#)

The database to update

Return Value

Type: [Boolean](#)

true if Database was updated, otherwise throws an exception

[VelocityDb.Session.SessionNoServer](#)

VelocityDb.Session.SessionNoServerShared

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class SessionNoServerShared : SessionNoServer,
    IDisposable
```

VB

```
Public Class SessionNoServerShared
    Inherits SessionNoServer
    Implements IDisposable
```

C++

```
public ref class SessionNoServerShared : public SessionNoServer,
    IDisposable
```

F#

```
type SessionNoServerShared =
    class
        inherit SessionNoServer
        interface IDisposable
    end
```

The **SessionNoServerShared** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------|
|  | SessionNoServerShared | Creates a new session. For a thread safe version of this class, use SessionNoServerShared |

Properties

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AddToIndexInSeperateThread | Allow adding objects to indices to be done in a worker thread instead of in main thread. (Overrides SessionBase.AddToIndexInSeperateThread.) |
|  Databases | Gets a list of the currently opened databases (Overrides SessionBase.Databases.) |
|  WriteToDiskInSeperateDatabaseThreads | Allow object serialization and page writes to happen in worker threads, one per database, instead of in main session thread. AddToIndexInSeperateThread must also be enabled for this to work. (Overrides SessionBase.WriteToDiskInSeperateDatabaseThreads.) |

Methods

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Abort | Transaction control, abort the current transaction (Overrides SessionBase.Abort().) |
|  BeginRead | Transaction control, begin a read only transaction (Overrides SessionBase.BeginRead(Boolean).) |
|  BeginUpdate | Transaction control, begin an update transaction. (Overrides SessionBase.BeginUpdate(Boolean).) |
|  Checkpoint | Same as Commit(Boolean, Boolean) followed by BeginUpdate() (Overrides SessionBase.Checkpoint().) |
|  ClearCache | Clears page cache and closes databases. Avoid using this one for now. (Overrides SessionBase.ClearCache().) |
|  ClearCachedPages | Clear cache of cached pages (Overrides SessionBase.ClearCachedPages().) |
|  ClearPageCache | Clears cached pages from cache including page weak references. (Overrides SessionBase.ClearPageCache().) |
|  Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides SessionBase.Compact().) |
|  Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides SessionBase.Compact(Database).) |
|  CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. (Overrides SessionBase.CopyAllDatabasesTo(String, Boolean).) |

| | | |
|---|--------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ⇒ | CrossTransactionCache | By default databases are only referenced by a WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened. (Overrides SessionBase.CrossTransactionCache(Database, Boolean).) |
| ⇒ | DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it (Overrides SessionBase.DeleteLocation(DatabaseLocation, Boolean).) |
| ⇒ | FileOpen | Opens a Database file for read/update. Internal use only. (Overrides SessionBase.FileOpen(Database, FileAccess, String, FileMode, Boolean, Int32, Boolean).) |
| ⇒ | FlushPageOf | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written. (Overrides SessionBase.FlushPageOf(OptimizedPersistable).) |
| ⇒ | FlushUpdates | Write all updated data. This may free up some memory. (Overrides SessionBase.FlushUpdates().) |
| ⇒ | ForceDatabaseCacheValidation | Cached data is set to be validated whenever a new transaction is started. This function is provided as a way to force cache validation within a transaction without requiring a commit followed by a new transaction. (Overrides SessionBase.ForceDatabaseCacheValidation().) |
| ⇒ | GlobalObjWrapperGet | Lookup wrapper object for a non IOptimizedPersistable object (Overrides SessionBase.GlobalObjWrapperGet(Object, IOptimizedPersistable).) |
| ⇒ | NewDatabase | Create a new Database with a given database number (Overrides SessionBase.NewDatabase(UInt32, UInt32, String, Boolean).) |
| ⇒ | NewLocation | Creates a new DatabaseLocation or updates existing ones (Overrides SessionBase.NewLocation(DatabaseLocation).) |
| ⇒ | Open(UInt64, Boolean, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt64, Boolean, Boolean, Int32).) |
| ⇒ | Open(UInt32, UInt16, UInt16, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt32, UInt16, UInt16, Boolean, Int32).) |

| | |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32) | For internal usage only, used in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32).) |
|  Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean) | For internal use only in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean).) |
|  OpenAllDatabases | Open all databases (Overrides SessionBase.OpenAllDatabases(Boolean).) |
|  OpenDatabase | Opens a Database (Overrides SessionBase.OpenDatabase(UInt32, Boolean, Boolean).) |
|  OpenLocationDatabases | Opens all the databases in a given location (Overrides SessionBase.OpenLocationDatabases(DatabaseLocation, Boolean).) |
|  OpenSchema | Get the session active schema (Overrides SessionBase.OpenSchema(Boolean).) |
|  Persist(IOptimizedPersistable, Nullable(UInt16)) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides PlacementDatabaseNumber and returns something other than DefaultPlacementDatabaseNumber . (Overrides SessionBase.Persist(IOptimizedPersistable, Nullable(UInt16)).) |
|  Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)) | Persists an object (Overrides SessionBase.Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)).) |
|  PossiblyFlushUpdatedPages | Call this function if you may have updated many pages to possibly free up memory if too much memory is in use. (Overrides SessionBase.PossiblyFlushUpdatedPages(UInt32).) |
|  RestoreFrom | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. (Overrides SessionBase.RestoreFrom(DatabaseLocation, DateTime).) |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides SessionBase.SubscribeToChanges(Type, String).) |
|  Unpersist | Use this when you want to delete objects that are not assignable as IOptimizedPersistable (Overrides SessionBase.Unpersist(Object).) |
|  UpdateDatabase | Request an update lock on a database (Overrides SessionNoServer.UpdateDatabase(Database).) |

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  UpdateObject(Object) | Tag an object as updated so that it will be updated persistently (Overrides SessionBase.UpdateObject(Object).) |
|  UpdateObject(IOptimizedPersistable, Boolean, Boolean) | Updates an object (Overrides SessionBase.UpdateObject(IOptimizedPersistable, Boolean, Boolean).) |
|  Verify | Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found. (Overrides SessionBase.Verify().) |

Extension Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. [VelocityDb.Session Namespace](#)

SessionNoServerShared Constructor

Creates a new session. For a thread safe version of this class, use [SessionNoServerShared](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SessionNoServerShared(
    string systemDir,
    int waitForLockMilliseconds = 5000,
    bool optimisticLocking = true,
    bool enablePageCache = true,
    CacheEnum objectCachingDefaultPolicy = CacheEnum.Yes,
    bool enableDatabaseCache = true
)
```

VB

```
Public Sub New (
    systemDir As String,
    Optional waitForLockMilliseconds As Integer = 5000,
    Optional optimisticLocking As Boolean = true,
    Optional enablePageCache As Boolean = true,
    Optional objectCachingDefaultPolicy As CacheEnum = CacheEnum.Yes,
    Optional enableDatabaseCache As Boolean = true
)
```

C++

```
public:
    SessionNoServerShared(
        String^ systemDir,
        int waitForLockMilliseconds = 5000,
        bool optimisticLocking = true,
        bool enablePageCache = true,
        CacheEnum objectCachingDefaultPolicy = CacheEnum::Yes,
        bool enableDatabaseCache = true
    )
```

F#

```
new :
    systemDir : string *
    ?waitForLockMilliseconds : int *
    ?optimisticLocking : bool *
    ?enablePageCache : bool *
    ?objectCachingDefaultPolicy : CacheEnum *
    ?enableDatabaseCache : bool
(* Defaults:
    let _waitForLockMilliseconds = defaultArg waitForLockMilliseconds 5000
    let _optimisticLocking = defaultArg optimisticLocking true
    let _enablePageCache = defaultArg enablePageCache true
```

```
        let_objectCachingDefaultPolicy = defaultArg
objectCachingDefaultPolicy CacheEnum.Yes
        let_enableDatabaseCache = defaultArg enableDatabaseCache true
*)
-> SessionNoServerShared
```

Parameters

systemDir

Type: [System.String](#)

The startup location directory path. Path can be an absolute (full) path or a path relative to **s_baseDatabasePath**

waitForLockMilliseconds (Optional)

Type: [System.Int32](#)

The desired maximum lock wait time

optimisticLocking (Optional)

Type: [System.Boolean](#)

Use optimistic locking. With optimistic locking, readers are always permitted and multiple updaters are permitted to update the same Databases/Pages but only the first transaction to commit or flush an updated Database/Page will be successful in making the committed change. Other updaters will get an `OptimisticLockingException` if they try to commit/flush updates to the same Pages/Database. See http://en.wikipedia.org/wiki/Optimistic_concurrency_control for further explanation of optimistic locking. If optimistic locking is not enabled then pessimistic locking is used. See: http://en.wikipedia.org/wiki/Concurrency_control

enablePageCache (Optional)

Type: [System.Boolean](#)

If strong reference page caching isn't desired, turn it off by setting to false

objectCachingDefaultPolicy (Optional)

Type: [VelocityDb.CacheEnum](#)

Determines default value of [Cache](#)

enableDatabaseCache (Optional)

Type: [System.Boolean](#)

Is this session going to enable strong reference [Database](#) caching?

SessionNoServerShared.SessionNoServerShared Methods

The [SessionNoServerShared](#) type exposes the following members.

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Abort | Transaction control, abort the current transaction (Overrides SessionBase.Abort().) |
|  BeginRead | Transaction control, begin a read only transaction (Overrides SessionBase.BeginRead(Boolean).) |
|  BeginUpdate | Transaction control, begin an update transaction. (Overrides SessionBase.BeginUpdate(Boolean).) |
|  Checkpoint | Same as Commit(Boolean, Boolean) followed by BeginUpdate() (Overrides SessionBase.Checkpoint().) |
|  ClearCache | Clears page cache and closes databases. Avoid using this one for now. (Overrides SessionBase.ClearCache().) |
|  ClearCachedPages | Clear cache of cached pages (Overrides SessionBase.ClearCachedPages().) |
|  ClearPageCache | Clears cached pages from cache including page weak references. (Overrides SessionBase.ClearPageCache().) |
|  Compact() | Reduce size of databases, if possible, by first attempting to relocate pages to free areas towards the beginning of each Database file and then by truncating files where unused space begins. Run Compact() outside the scope of any transaction. (Overrides SessionBase.Compact().) |
|  Compact(Database) | Reduce size of database, if possible, by truncating file where unused space begins (Overrides SessionBase.Compact(Database).) |
|  CopyAllDatabasesTo | Copies all databases to a selected directory on the local host. (Overrides SessionBase.CopyAllDatabasesTo(String, Boolean).) |
|  CrossTransactionCache | By default databases are only referenced by a WeakReference across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened. (Overrides SessionBase.CrossTransactionCache(Database, Boolean).) |

| | |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  DeleteLocation | Deletes a DatabaseLocation , location must first not have any Databases in it (Overrides SessionBase.DeleteLocation(DatabaseLocation, Boolean).) |
|  FileOpen | Opens a Database file for read/update. Internal use only. (Overrides SessionBase.FileOpen(Database, FileAccess, String, FileMode, Boolean, Int32, Boolean).) |
|  FlushPageOf | By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written. (Overrides SessionBase.FlushPageOf(OptimizedPersistable).) |
|  FlushUpdates | Write all updated data. This may free up some memory. (Overrides SessionBase.FlushUpdates().) |
|  ForceDatabaseCacheValidation | Cached data is set to be validated whenever a new transaction is started. This function is provided as a way to force cache validation within a transaction without requiring a commit followed by a new transaction. (Overrides SessionBase.ForceDatabaseCacheValidation().) |
|  GlobalObjWrapperGet | Lookup wrapper object for a non IOptimizedPersistable object (Overrides SessionBase.GlobalObjWrapperGet(Object, IOptimizedPersistable).) |
|  NewDatabase | Create a new Database with a given database number (Overrides SessionBase.NewDatabase(UInt32, UInt32, String, Boolean).) |
|  NewLocation | Creates a new DatabaseLocation or updates existing ones (Overrides SessionBase.NewLocation(DatabaseLocation).) |
|  Open(UInt64, Boolean, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt64, Boolean, Boolean, Int32).) |
|  Open(UInt32, UInt16, UInt16, Boolean, Int32) | Opens a persistent object (Overrides SessionBase.Open(UInt32, UInt16, UInt16, Boolean, Int32).) |
|  Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32) | For internal usage only, used in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32).) |
|  Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean) | For internal use only in generated code (Overrides SessionBase.Open(Database, UInt64, Boolean, List(IOptimizedPersistable), Boolean, Int32, Int32, Boolean).) |
|  OpenAllDatabases | Open all databases (Overrides SessionBase.OpenAllDatabases(Boolean).) |
|  OpenDatabase | Opens a Database (Overrides SessionBase.OpenDatabase(UInt32, Boolean, Boolean).) |

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  OpenLocationDatabases | Opens all the databases in a given location (Overrides SessionBase.OpenLocationDatabases(DatabaseLocation, Boolean).) |
|  OpenSchema | Get the session active schema (Overrides SessionBase.OpenSchema(Boolean).) |
|  Persist(IOptimizedPersistable, Nullable(UInt16)) | This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides PlacementDatabaseNumber and returns something other than DefaultPlacementDatabaseNumber . (Overrides SessionBase.Persist(IOptimizedPersistable, Nullable(UInt16)).) |
|  Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)) | Persists an object (Overrides SessionBase.Persist(Placement, IOptimizedPersistable, Schema, UInt16, Boolean, Queue(IOptimizedPersistable)).) |
|  PossiblyFlushUpdatedPages | Call this function if you may have updated many pages to possibly free up memory if too much memory is in use. (Overrides SessionBase.PossiblyFlushUpdatedPages(UInt32).) |
|  RestoreFrom | Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore. (Overrides SessionBase.RestoreFrom(DatabaseLocation, DateTime).) |
|  SubscribeToChanges | Subscribe to committed database changes of instances of a type when an optional property evaluates to true. (Overrides SessionBase.SubscribeToChanges(Type, String).) |
|  Unpersist | Use this when you want to delete objects that are not assignable as IOptimizedPersistable (Overrides SessionBase.Unpersist(Object).) |
|  UpdateDatabase | Request an update lock on a database (Overrides SessionNoServer.UpdateDatabase(Database).) |
|  UpdateObject(Object) | Tag an object as updated so that it will be updated persistently (Overrides SessionBase.UpdateObject(Object).) |
|  UpdateObject(IOptimizedPersistable, Boolean, Boolean) | Updates an object (Overrides SessionBase.UpdateObject(IOptimizedPersistable, Boolean, Boolean).) |
|  Verify | Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found. (Overrides SessionBase.Verify().) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx (Defined by ImportExportCsv.) |
|  | ExportToJson(T)(UInt64) | Overloaded. (Defined by JsonImportExport.) |

```
Public Overrides Function BeginRead (  
    Optional doRecoveryCheck As Boolean = false  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginRead(  
    bool doRecoveryCheck = false  
) override
```

F#

```
abstract BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction  
override BeginRead :  
    ?doRecoveryCheck : bool  
(* Defaults:  
    let _doRecoveryCheck = defaultArg doRecoveryCheck false  
)  
-> SessionBase.Transaction
```

Parameters

doRecoveryCheck (Optional)

Type: [System.Boolean](#)

By default we do not check for a failed update transaction that requires reverting one or more database changes. We don't do it by default because it can be a little costly. Change this parameter to `true` if you prefer ensured consistency over better performance or make change only if you encounter an exception in the transaction.

VelocityDB Class Library

Return Value

Type: [SessionBase.Transaction](#)

A transaction helper object.

See Also

[SessionNoServerShared Class](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.BeginUpdate Method

Transaction control, begin an update transaction.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override SessionBase.Transaction BeginUpdate(  
    bool doRecoveryCheck  
)
```

VB

```
Public Overrides Function BeginUpdate (  
    doRecoveryCheck As Boolean  
) As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ BeginUpdate (  
    bool doRecoveryCheck  
) override
```

F#

```
abstract BeginUpdate :  
    doRecoveryCheck : bool -> SessionBase.Transaction  
override BeginUpdate :  
    doRecoveryCheck : bool -> SessionBase.Transaction
```

Parameters

doRecoveryCheck

Type: [System.Boolean](#)

Set to false only when moving system databases to a new directory

Return Value

Type: [SessionBase.Transaction](#)

A [SessionBase.Transaction](#) helper object.

SessionNoServerShared.Checkpoint Method

Same as [Commit\(Boolean, Boolean\)](#) followed by [BeginUpdate\(\)](#)

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override SessionBase.Transaction Checkpoint ()
```

VB

```
Public Overrides Function Checkpoint As SessionBase.Transaction
```

C++

```
public:  
virtual SessionBase.Transaction^ Checkpoint () override
```

F#

```
abstract Checkpoint : unit -> SessionBase.Transaction  
override Checkpoint : unit -> SessionBase.Transaction
```

Return Value

Type: [SessionBase.Transaction](#)

[SessionBase.Transaction](#) started

SessionNoServerShared.CopyAllDatabasesTo Method

Copies all databases to a selected directory on the local host.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void CopyAllDatabasesTo(  
    string directory,  
    bool systemDatabaseLocationOnly  
)
```

VB

```
Public Overrides Sub CopyAllDatabasesTo (  
    directory As String,  
    systemDatabaseLocationOnly As Boolean  
)
```

C++

```
public:  
virtual void CopyAllDatabasesTo(  
    String^ directory,  
    bool systemDatabaseLocationOnly  
) override
```

F#

```
abstract CopyAllDatabasesTo :  
    directory : string *  
    systemDatabaseLocationOnly : bool -> unit  
override CopyAllDatabasesTo :  
    directory : string *  
    systemDatabaseLocationOnly : bool -> unit
```

Parameters

directory

Type: [System.String](#)

Path to a directory

systemDatabaseLocationOnly

Type: [System.Boolean](#)

[Missing <param name="systemDatabaseLocationOnly"/> documentation for "M:VelocityDb.Session.SessionNoServerShared.CopyAllDatabasesTo(System.String,System.Boolean)"]

See Also

[SessionNoServerShared Class](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.CrossTransactionCache Method

By default databases are only referenced by a [WeakReference](#) across transaction boundaries. This means that such Database may or may not be available as a cached database depending on garbage collection activity and if such database also has a strong reference. This function lets you add a strong reference to a Database so the cached Database may be used if version wasn't changed by a different thread since prior transaction. The strong reference is removed once the Database is reopened.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void CrossTransactionCache (
    Database db,
    bool enable = true
)
```

VB

```
Public Overrides Sub CrossTransactionCache (
    db As Database,
    Optional enable As Boolean = true
)
```

C++

```
public:
virtual void CrossTransactionCache (
    Database^ db,
    bool enable = true
) override
```

F#

```
abstract CrossTransactionCache :
    db : Database *
    ?enable : bool
(* Defaults:
    let _enable = defaultArg enable true
*)
-> unit
override CrossTransactionCache :
    db : Database *
    ?enable : bool
(* Defaults:
    let _enable = defaultArg enable true
*)
-> unit
```

Parameters

db

VelocityDB Class Library

Type: [VelocityDb.Database](#)

The Database to cache

enable (Optional)

Type: [System.Boolean](#)

Add or remove strong reference. If true, add a strong reference

SessionNoServerShared.DeleteLocation Method

Deletes a [DatabaseLocation](#), location must first not have any Databases in it

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void DeleteLocation(  
    DatabaseLocation location,  
    bool catalogOnly = false  
)
```

VB

```
Public Overrides Sub DeleteLocation (  
    location As DatabaseLocation,  
    Optional catalogOnly As Boolean = false  
)
```

C++

```
public:  
virtual void DeleteLocation(  
    DatabaseLocation^ location,  
    bool catalogOnly = false  
) override
```

F#

```
abstract DeleteLocation :  
    location : DatabaseLocation *  
    ?catalogOnly : bool  
(* Defaults:  
    let_catalogOnly = defaultArg catalogOnly false  
)  
-> unit  
override DeleteLocation :  
    location : DatabaseLocation *  
    ?catalogOnly : bool  
(* Defaults:  
    let_catalogOnly = defaultArg catalogOnly false  
)  
-> unit
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The DatabaseLocation to delete

catalogOnly (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Of true, only delete catalog entry. Leave the directory as is.

SessionNoServerShared.FileOpen Method

Opens a [Database](#) file for read/update. Internal use only.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override Stream FileOpen(
    Database db,
    FileAccess fileAccess,
    ref string errorMessage,
    FileMode fileMode = FileMode.Open,
    bool exclusiveAccess = false,
    int waitOverride = 0,
    bool signalError = true
)
```

VB

```
Public Overrides Function FileOpen (
    db As Database,
    fileAccess As FileAccess,
    ByRef errorMessage As String,
    Optional fileMode As FileMode = FileMode.Open,
    Optional exclusiveAccess As Boolean = false,
    Optional waitOverride As Integer = 0,
    Optional signalError As Boolean = true
) As Stream
```

C++

```
public:
virtual Stream^ FileOpen(
    Database^ db,
    FileAccess fileAccess,
    String^% errorMessage,
    FileMode fileMode = FileMode::Open,
    bool exclusiveAccess = false,
    int waitOverride = 0,
    bool signalError = true
) override
```

F#

```
abstract FileOpen :
    db : Database *
    fileAccess : FileAccess *
    errorMessage : string byref *
    ?fileMode : FileMode *
    ?exclusiveAccess : bool *
    ?waitOverride : int *
    ?signalError : bool
```

```
(* Defaults:
    let_fileMode = defaultArg fileMode FileMode.Open
    let_exclusiveAccess = defaultArg exclusiveAccess false
    let_waitOverride = defaultArg waitOverride 0
    let_signalError = defaultArg signalError true
*)
-> Stream
override FileOpen :
    db : Database *
    fileAccess : FileAccess *
    errorMessage : string byref *
    ?fileMode : FileMode *
    ?exclusiveAccess : bool *
    ?waitOverride : int *
    ?signalError : bool
(* Defaults:
    let_fileMode = defaultArg fileMode FileMode.Open
    let_exclusiveAccess = defaultArg exclusiveAccess false
    let_waitOverride = defaultArg waitOverride 0
    let_signalError = defaultArg signalError true
*)
-> Stream
```

Parameters

db

Type: [VelocityDb.Database](#)

[Database](#)

for which we want to open [Stream](#)

fileAccess

Type: [System.IO.FileAccess](#)

Opening for read or update?

errorMessage

Type: [System.String](#)

Used for passing error messages back to caller

fileMode (Optional)

Type: [System.IO.FileMode](#)

[FileMode](#)

used for opening file

exclusiveAccess (Optional)

Type: [System.Boolean](#)

Do we want exclusive access to file?

waitOverride (Optional)

Type: [System.Int32](#)

How long are we willing to wait for a file lock to clear?

VelocityDB Class Library

signalError (Optional)

Type: [System.Boolean](#)

Throw exception if we can't open file within wait time?

Return Value

Type: [Stream](#)

A [Stream](#) used for accessing [Database](#) data

SessionNoServerShared.FlushPageOf Method

By calling this you force a persisted (has an Id) object to be written to disk (if updated) and indices (if any) to be updated. Other objects on the same page page will also be written.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void FlushPageOf(  
    OptimizedPersistable pObj  
)
```

VB

```
Public Overrides Sub FlushPageOf (  
    pObj As OptimizedPersistable  
)
```

C++

```
public:  
virtual void FlushPageOf(  
    OptimizedPersistable^ pObj  
) override
```

F#

```
abstract FlushPageOf :  
    pObj : OptimizedPersistable -> unit  
override FlushPageOf :  
    pObj : OptimizedPersistable -> unit
```

Parameters

pObj

Type: [VelocityDb.OptimizedPersistable](#)

An object indicating what [Page](#) to flush

See Also

Lookup wrapper object for a non IOptimizedPersistable object

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool GlobalObjWrapperGet (
    Object lookupObj,
    out IOptimizedPersistable pObj
)
```

VB

```
Public Overrides Function GlobalObjWrapperGet (
    lookupObj As Object,
    <OutAttribute> ByRef pObj As IOptimizedPersistable
) As Boolean
```

C++

```
public:
virtual bool GlobalObjWrapperGet (
    Object^ lookupObj,
    [OutAttribute] IOptimizedPersistable^% pObj
) override
```

F#

```
abstract GlobalObjWrapperGet :
    lookupObj : Object *
    pObj : IOptimizedPersistable byref -> bool
override GlobalObjWrapperGet :
    lookupObj : Object *
    pObj : IOptimizedPersistable byref -> bool
```

Parameters

lookupObj

Type: [System.Object](#)

object to look for

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

wrapper object

Return Value

Type: [Boolean](#)

Wrapper object

VelocityDB Class Library

SessionNoServerShared.NewDatabase Method

Create a new Database with a given database number

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override Database NewDatabase(
    uint dbNum,
    uint megaBytesPresize = 0,
    string name = null,
    bool signalError = true
)
```

VB

```
Public Overrides Function NewDatabase (
    dbNum As UInteger,
    Optional megaBytesPresize As UInteger = 0,
    Optional name As String = Nothing,
    Optional signalError As Boolean = true
) As Database
```

C++

```
public:
virtual Database^ NewDatabase(
    unsigned int dbNum,
    unsigned int megaBytesPresize = 0,
    String^ name = nullptr,
    bool signalError = true
) override
```

F#

```
abstract NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
    let_megaBytesPresize = defaultArg megaBytesPresize 0
    let_name = defaultArg name null
    let_signalError = defaultArg signalError true
*)
-> Database
override NewDatabase :
    dbNum : uint32 *
    ?megaBytesPresize : uint32 *
    ?name : string *
    ?signalError : bool
(* Defaults:
```

VelocityDB Class Library

```
        let_megaBytesPresize = defaultArg megaBytesPresize 0
        let_name = defaultArg name null
        let_signalError = defaultArg signalError true
*)
-> Database
```

Parameters

dbNum

Type: [System.UInt32](#)

Database number of the database to create

megaBytesPresize (Optional)

Type: [System.UInt32](#)

If you know that the Database will be large, presizing it may avoid file fragmentation. Default value is 0

name (Optional)

Type: [System.String](#)

Optionally name the new [Database](#)

signalError (Optional)

Type: [System.Boolean](#)

Optionally signal an error if creation of new [Database](#) fails

Return Value

Type: [Database](#)

The newly created [Database](#) or throws an exception if the [Database](#) already exist

Opens a persistent object

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override Object Open(
    ulong oid,
    bool update,
    bool inFlush,
    int graphDepthToLoad = 2147483647
)
```

VB

```
Public Overrides Function Open (
    oid As ULong,
    update As Boolean,
    inFlush As Boolean,
    Optional graphDepthToLoad As Integer = 2147483647
) As Object
```

C++

```
public:
virtual Object^ Open(
    unsigned long long oid,
    bool update,
    bool inFlush,
    int graphDepthToLoad = 2147483647
) override
```

F#

```
abstract Open :
    oid : uint64 *
    update : bool *
    inFlush : bool *
    ?graphDepthToLoad : int
(* Defaults:
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
*)
-> Object
override Open :
    oid : uint64 *
    update : bool *
    inFlush : bool *
    ?graphDepthToLoad : int
(* Defaults:
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
```

```
* )  
-> Object
```

Parameters

oid

Type: [System.UInt64](#)

The Id of the object to open

update

Type: [System.Boolean](#)

Open the object for update?

inFlush

Type: [System.Boolean](#)

if true, disallow page flushing while opening the object

graphDepthToLoad (Optional)

Type: [System.Int32](#)

Set this if you want to limit the depth of the graph loaded by this open.

Return Value

Type: [Object](#)

A persistent object

)  
-> IOptimizedPersistable  
override Open :  
    dbNum : uint32 *
```

VelocityDB Class Library

```
    pageNum : uint16 *
    slotNum : uint16 *
    update : bool *
    ?graphDepthToLoad : int
(* Defaults:
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
*)
-> IOptimizedPersistable
```

Parameters

dbNum

Type: [System.UInt32](#)

Database number of the object to open

pageNum

Type: [System.UInt16](#)

Page number of the object to open

slotNum

Type: [System.UInt16](#)

Slot number of the object to open

update

Type: [System.Boolean](#)

Open the object for update?

graphDepthToLoad (Optional)

Type: [System.Int32](#)

Limit depth of graph to open

Return Value

Type: [IOptimizedPersistable](#)

The opened object or null if it does not exist

[Open Overload](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.Open Method (Database, UInt64, Boolean, List<IOptimizedPersistable>, Boolean, Int32, Int32)

For internal usage only, used in generated code

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override IOptimizedPersistable Open(
    Database db,
    ulong oid,
    bool update,
    List<IOptimizedPersistable> toLoadMembers,
    bool inFlush,
    int graphDepth = 0,
    int graphDepthToLoad = 2147483647
)
```

VB

```
Public Overrides Function Open (
    db As Database,
    oid As ULong,
    update As Boolean,
    toLoadMembers As List(Of IOptimizedPersistable),
    inFlush As Boolean,
    Optional graphDepth As Integer = 0,
    Optional graphDepthToLoad As Integer = 2147483647
) As IOptimizedPersistable
```

C++

```
public:
virtual IOptimizedPersistable^ Open(
    Database^ db,
    unsigned long long oid,
    bool update,
    List<IOptimizedPersistable^>^ toLoadMembers,
    bool inFlush,
    int graphDepth = 0,
    int graphDepthToLoad = 2147483647
) override
```

F#

```
abstract Open :
    db : Database *
    oid : uint64 *
    update : bool *
    toLoadMembers : List<IOptimizedPersistable> *
    inFlush : bool *
```

```
        ?graphDepth : int *
        ?graphDepthToLoad : int
(* Defaults:
    let_graphDepth = defaultArg graphDepth 0
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
*)
-> IOptimizedPersistable
override Open :
    db : Database *
    oid : uint64 *
    update : bool *
    toLoadMembers : List<IOptimizedPersistable> *
    inFlush : bool *
    ?graphDepth : int *

(* Defaults:
    let_graphDepth = defaultArg graphDepth 0
    let_graphDepthToLoad = defaultArg graphDepthToLoad 2147483647
*)
-> IOptimizedPersistable
```

Parameters

db

Type: [VelocityDb.Database](#)

[Missing <param name="db"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

oid

Type: [System.UInt64](#)

[Missing <param name="oid"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

update

Type: [System.Boolean](#)

[Missing <param name="update"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

[Missing <param name="toLoadMembers"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

inFlush

Type: [System.Boolean](#)

[Missing <param name="inFlush"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

graphDepth (Optional)

Type: [System.Int32](#)

[Missing <param name="graphDepth"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

graphDepthToLoad (Optional)

Type: [System.Int32](#)

[Missing <param name="graphDepthToLoad"/> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

Return Value

Type: [IOptimizedPersistable](#)

[Missing <returns> documentation for

"M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32)"]

    graphDepthToLoad : int *
    ?signalNotExistError : bool
(* Defaults:
    let_signalNotExistError = defaultArg signalNotExistError false
*)
-> IOptimizedPersistable
```

Parameters

db

Type: [VelocityDb.Database](#)

[Missing <param name="db"/> documentation for "M:VelocityDb.Session.SessionNoServerShared.Open(VelocityDb.Database,System.UInt64,System.Boolean,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Boolean,System.Int32,System.Int32,System.Boolean)"]

oid

Type: [System.UInt64](#)

Id of the object to open, must match with Database id

update

Type: [System.Boolean](#)

Update object when opening it

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

Internal list of objects to be loaded as part of graph load

inFlush

Type: [System.Boolean](#)

Permit page flushes as side affect of opening object?

graphDepth

Type: [System.Int32](#)

Current graph depth of graph load

VelocityDB Class Library

graphDepthToLoad

Type: [System.Int32](#)

Max graph depth to load

signalNotExistError (Optional)

Type: [System.Boolean](#)

Signal an exception if object/page/database does not exist.

Return Value

Type: [IOptimizedPersistable](#)

a persistent object

    let_signalError = defaultArg signalError true
*)
-> Database
```

VelocityDB Class Library

Parameters

dbNum

Type: [System.UInt32](#)

The Database number of the database to open

update (Optional)

Type: [System.Boolean](#)

Open the Database for update?

signalError (Optional)

Type: [System.Boolean](#)

Signal errors if errors found when opening the Database?

Return Value

Type: [Database](#)

The opened Database

    ?update : bool  
(* Defaults:  
    let_update = defaultArg update false  
*)  
-> List<Database>
```

Parameters

location

Type: [VelocityDb.DatabaseLocation](#)

The location for which to open databases

update (Optional)

VelocityDB Class Library

Type: [System.Boolean](#)

Shall each database be opened for update?

Return Value

Type: [List\(Database\)](#)

A list of opened databases

SessionNoServerShared.Persist Method (IOptimizedPersistable, Nullable(UInt16))

This is the recommended way of persisting objects, it is simple and efficient. Each type is stored in its own database unless object class overrides [PlacementDatabaseNumber](#) and returns something other than [DefaultPlacementDatabaseNumber](#).

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override ulong Persist(
    IOptimizedPersistable ipObj,
    ushort? objectsPerPage = null
)
```

VB

```
Public Overrides Function Persist (
    ipObj As IOptimizedPersistable,
    Optional objectsPerPage As UShort? = Nothing
) As ULong
```

C++

```
public:
virtual unsigned long long Persist(
    IOptimizedPersistable^ ipObj,
    Nullable<unsigned short> objectsPerPage = nullptr
) override
```

F#

```
abstract Persist :
    ipObj : IOptimizedPersistable *
    ?objectsPerPage : Nullable<uint16>
(* Defaults:
    let _objectsPerPage = defaultArg objectsPerPage null
*)
-> uint64
override Persist :
    ipObj : IOptimizedPersistable *
    ?objectsPerPage : Nullable<uint16>
(* Defaults:
    let _objectsPerPage = defaultArg objectsPerPage null
*)
-> uint64
```

Parameters

ipObj

VelocityDB Class Library

Type: [VelocityDb.IOptimizedPersistable](#)

The object to make persistent

objectsPerPage (Optional)

Type: [System.Nullable\(UInt16\)](#)

Override of objects per page, only respected when persisting first object of some type

Return Value

Type: [UInt64](#)

The Id of the persisted object

See Also

    schema : Schema *
    ?slotLimitPerPage : uint16 *
    ?inFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
```

```
(* Defaults:
    let_slotLimitPerPage = defaultArg slotLimitPerPage 0
    let_inFlush = defaultArg inFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
override Persist :
    place : Placement *
    pObj : IOptimizedPersistable *
    schema : Schema *
    ?slotLimitPerPage : uint16 *
    ?inFlush : bool *
    ?toPersist : Queue<IOptimizedPersistable>
(* Defaults:
    let_slotLimitPerPage = defaultArg slotLimitPerPage 0
    let_inFlush = defaultArg inFlush false
    let_toPersist = defaultArg toPersist null
*)
-> uint64
```

Parameters

place

Type: [VelocityDb.Placement](#)

Placement object determining where to persist the object

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

The object to persist

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active session schema

slotLimitPerPage (Optional)

Type: [System.UInt16](#)

Override of how many slots per page to permit

inFlush (Optional)

Type: [System.Boolean](#)

Set to true to disallow page flushes as a side affect

toPersist (Optional)

Type: [System.Collections.Generic.Queue<IOptimizedPersistable>](#)

A list of objects waiting to be persisted

Return Value

Type: [UInt64](#)

Id of persisted object

[VelocityDb.Session Namespace](#)

SessionNoServerShared.PossiblyFlushUpdatedPages Method

Call this function if you may have updated many pages to possibly free up memory if too much memory is in use.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void PossiblyFlushUpdatedPages (
    uint numberOfUpdatedPagesPermittedWithoutFlushCheck = 100
)
```

VB

```
Public Overrides Sub PossiblyFlushUpdatedPages (
    Optional numberOfUpdatedPagesPermittedWithoutFlushCheck As UInteger =
100
)
```

C++

```
public:
virtual void PossiblyFlushUpdatedPages (
    unsigned int numberOfUpdatedPagesPermittedWithoutFlushCheck = 100
) override
```

F#

```
abstract PossiblyFlushUpdatedPages :
    ?numberOfUpdatedPagesPermittedWithoutFlushCheck : uint32
(* Defaults:
    let numberOfUpdatedPagesPermittedWithoutFlushCheck = defaultArg
numberOfUpdatedPagesPermittedWithoutFlushCheck 100
*)
-> unit
override PossiblyFlushUpdatedPages :
    ?numberOfUpdatedPagesPermittedWithoutFlushCheck : uint32
(* Defaults:
    let numberOfUpdatedPagesPermittedWithoutFlushCheck = defaultArg
numberOfUpdatedPagesPermittedWithoutFlushCheck 100
*)
-> unit
```

Parameters

numberOfUpdatedPagesPermittedWithoutFlushCheck (Optional)

Type: [System.UInt32](#)

Only do check if the number of updated pages is greater than this number

SessionNoServerShared.RestoreFrom Method

Restores Databases and pages from a backup DatabaseLocation. Existing data will be merged with the restored data unless existing Databases to restore are deleted before the restore.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void RestoreFrom(  
    DatabaseLocation backupLocation,  
    DateTime upToTime  
)
```

VB

```
Public Overrides Sub RestoreFrom (  
    backupLocation As DatabaseLocation,  
    upToTime As DateTime  
)
```

C++

```
public:  
virtual void RestoreFrom(  
    DatabaseLocation^ backupLocation,  
    DateTime upToTime  
) override
```

F#

```
abstract RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit  
override RestoreFrom :  
    backupLocation : DatabaseLocation *  
    upToTime : DateTime -> unit
```

Parameters

backupLocation

Type: [VelocityDb.DatabaseLocation](#)

The location to restore from

upToTime

Type: [System.DateTime](#)

Restore location up to a given DateTime. Data backed up after this time will not be restored.

[SessionNoServerShared Class](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.SubscribeToChanges Method

Subscribe to committed database changes of instances of a type when an optional property evaluates to true.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void SubscribeToChanges (
    Type aType,
    string notifyIfTrueProperty = null
)
```

VB

```
Public Overrides Sub SubscribeToChanges (
    aType As Type,
    Optional notifyIfTrueProperty As String = Nothing
)
```

C++

```
public:
virtual void SubscribeToChanges (
    Type^ aType,
    String^ notifyIfTrueProperty = nullptr
) override
```

F#

```
abstract SubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
override SubscribeToChanges :
    aType : Type *
    ?notifyIfTrueProperty : string
(* Defaults:
    let_notifyIfTrueProperty = defaultArg notifyIfTrueProperty null
*)
-> unit
```

Parameters

aType

Type: [System.Type](#)

The type you are interested in being notified about when persistent instances changes within a database.

notifyIfTrueProperty (Optional)

Type: [System.String](#)

The name of a property part of the type specified as aType, this should be a Boolean property. When property returns true, a change notification is send otherwise no notification is send. Leave as null to get a notification any time any instance of the selected type changes

[SessionNoServerShared Class](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.UpdateObject Method (Object)

Tag an object as updated so that it will be updated persistently

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public override bool UpdateObject(  
    Object obj  
)
```

```
VB  
Public Overrides Function UpdateObject (  
    obj As Object  
) As Boolean
```

```
C++  
public:  
virtual bool UpdateObject(  
    Object^ obj  
) override
```

```
F#  
abstract UpdateObject :  
    obj : Object -> bool  
override UpdateObject :  
    obj : Object -> bool
```

Parameters

obj

Type: [System.Object](#)

The object to update.

Return Value

Type: [Boolean](#)

true if object updated; otherwise false

See Also

[SessionNoServerShared Class](#)

[UpdateObject Overload](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.UpdateObject Method (IOptimizedPersistable, Boolean, Boolean)

Updates an object

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool UpdateObject(  
    IOptimizedPersistable obj,  
    bool inFlush,  
    bool deleteObjFromIndexes = true  
)
```

VB

```
Public Overrides Function UpdateObject (  
    obj As IOptimizedPersistable,  
    inFlush As Boolean,  
    Optional deleteObjFromIndexes As Boolean = true  
) As Boolean
```

C++

```
public:  
virtual bool UpdateObject(  
    IOptimizedPersistable^ obj,  
    bool inFlush,  
    bool deleteObjFromIndexes = true  
) override
```

F#

```
abstract UpdateObject :  
    obj : IOptimizedPersistable *  
    inFlush : bool *  
    ?deleteObjFromIndexes : bool  
(* Defaults:  
    let_deleteObjFromIndexes = defaultArg deleteObjFromIndexes true  
)  
-> bool  
override UpdateObject :  
    obj : IOptimizedPersistable *  
    inFlush : bool *  
    ?deleteObjFromIndexes : bool  
(* Defaults:  
    let_deleteObjFromIndexes = defaultArg deleteObjFromIndexes true  
)  
-> bool
```

VelocityDB Class Library

Parameters

obj

Type: [VelocityDb.IOptimizedPersistable](#)

Object to be updated

inFlush

Type: [System.Boolean](#)

Are we doing this as part of a page flush? Set to true to avoid a recursive page flush

deleteObjFromIndexes (Optional)

Type: [System.Boolean](#)

Set to false if you know that this object is not part of any index. Safe to leave set to true in any case

Return Value

Type: [Boolean](#)

True if object is updated; otherwise false

[UpdateObject Overload](#)

[VelocityDb.Session Namespace](#)

SessionNoServerShared.Verify Method

Verifies that databases are valid by reading and following references. An exception is thrown if an issue is found.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Verify()
```

VB

```
Public Overrides Sub Verify
```

C++

```
public:  
virtual void Verify() override
```

F#

```
abstract Verify : unit -> unit  
override Verify : unit -> unit
```

[SessionNoServerShared Class](#)

[VelocityDb.Session Namespace](#)

SessionPool Class

Provides a pool of sessions for reuse instead of creating new session instances every time a session is needed. The pooled sessions includes cached databases, pages and objects. Keep the pool size to a minimum too avoid excessive memory usage.

Inheritance Hierarchy

[System.Object](#)

VelocityDb.Session.SessionPool

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class SessionPool : IDisposable,
    IComparable<SessionPool>
```

VB

```
Public Class SessionPool
    Implements IDisposable, IComparable(Of SessionPool)
```

C++

```
public ref class SessionPool : IDisposable,
    IComparable<SessionPool^>
```

F#

```
type SessionPool =
    class
        interface IDisposable
        interface IComparable<SessionPool>
    end
```

The **SessionPool** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------|
|  | SessionPool | Creates a session pool, store this pool somewhere where your application threads can get to it. |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|------------------------------------|
|  | Dispose | Disposes all sessions in this pool |

VelocityDB Class Library

| | |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
|  FreeSession | Always call this function so that your session is unlocked and becomes available to others |
|  GetSession | Get a session locked for use by caller. |

[VelocityDb.Session Namespace](#)

SessionPool Constructor

Creates a session pool, store this pool somewhere where your application threads can get to it.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SessionPool(  
    int poolSize,  
    Func<SessionBase> createSessionFunc  
)
```

VB

```
Public Sub New (  
    poolSize As Integer,  
    createSessionFunc As Func(Of SessionBase)  
)
```

C++

```
public:  
SessionPool(  
    int poolSize,  
    Func<SessionBase^>^ createSessionFunc  
)
```

F#

```
new :  
    poolSize : int *  
    createSessionFunc : Func<SessionBase> -> SessionPool
```

Parameters

poolSize

Type: [System.Int32](#)

The maximum number of session maintained in the pool

createSessionFunc

Type: [System.Func\(SessionBase\)](#)

A function provided by you that creates a session of your choice with your choice of parameters. Could be something as simple as: `() => new SessionNoServer("MyDbDir")`

See Also

SessionPool.SessionPool Methods

The [SessionPool](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------|--------------------------------------------------------------------------------------------|
|  | Dispose | Disposes all sessions in this pool |
|  | FreeSession | Always call this function so that your session is unlocked and becomes available to others |
|  | GetSession | Get a session locked for use by caller. |

See Also

[SessionPool Class](#)

[VelocityDb.Session Namespace](#)

SessionPool.Dispose Method

Disposes all sessions in this pool

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void Dispose ()
```

VB

```
Public Sub Dispose
```

C++

```
public:  
virtual void Dispose () sealed
```

F#

```
abstract Dispose : unit -> unit  
override Dispose : unit -> unit
```

Implements

[IDisposable.Dispose\(\)](#)

See Also

[SessionPool Class](#)

[VelocityDb.Session Namespace](#)

SessionPool.FreeSession Method

Always call this function so that your session is unlocked and becomes available to others

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void FreeSession(  
    int identifier,  
    SessionBase session  
)
```

VB

```
Public Sub FreeSession (  
    identifier As Integer,  
    session As SessionBase  
)
```

C++

```
public:  
void FreeSession(  
    int identifier,  
    SessionBase^ session  
)
```

F#

```
member FreeSession :  
    identifier : int *  
    session : SessionBase -> unit
```

Parameters

identifier

Type: [System.Int32](#)

The identifier provided by [GetSession\(Int32\)](#)

session

Type: [VelocityDb.Session.SessionBase](#)

The session provided by [GetSession\(Int32\)](#)

See Also

[SessionPool Class](#)

[VelocityDb.Session Namespace](#)

SessionPool.GetSession Method

Get a session locked for use by caller.

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public SessionBase GetSession(  
    out int identifier  
)
```

VB

```
Public Function GetSession (  
    <OutAttribute> ByRef identifier As Integer  
) As SessionBase
```

C++

```
public:  
SessionBase^ GetSession(  
    [OutAttribute] int% identifier  
)
```

F#

```
member GetSession :  
    identifier : int byref -> SessionBase
```

Parameters

identifier

Type: [System.Int32](#)

The id of the returned session. Make sure you always call FreeSession with this id provided or else session is locked forever. One way is to call FreeSession in a finally block.

Return Value

Type: [SessionBase](#)

A reserved/locked session

TypeExtensions Class

Some extensions to Type

[Inheritance Hierarchy](#)

[System.Object](#)

VelocityDb.Session.TypeExtensions

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static class TypeExtensions
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class TypeExtensions
```

C++

```
[ExtensionAttribute]  
public ref class TypeExtensions abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type TypeExtensions = class end
```

The **TypeExtensions** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|---------------------------------------------------------------------------------|
|   | ExpandsToNonPrimitiveTypes | Used by Database Manager |
|   | GetTypeCode | |
|   | ToGenericTypeString | Gets a string representation of a Type corresponding to how it looks in C# code |

See Also

[VelocityDb.Session Namespace](#)

TypeExtensions.TypeExtensions Methods

The [TypeExtensions](#) type exposes the following members.

Methods

| | Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|---------------------------------------------------------------------------------|
|   | ExpandsToNonPrimitiveTypes | Used by Database Manager |
|   | GetTypeCode | |
|   | ToGenericTypeString | Gets a string representation of a Type corresponding to how it looks in C# code |

TypeExtensions.ExpandsToNonPrimitiveTypes Method

Used by Database Manager

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool ExpandsToNonPrimitiveTypes (  
    this Type t  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Function ExpandsToNonPrimitiveTypes (  
    t As Type  
) As Boolean
```

C++

```
public:  
[ExtensionAttribute]  
static bool ExpandsToNonPrimitiveTypes (  
    Type^ t  
)
```

F#

```
[<ExtensionAttribute>]  
static member ExpandsToNonPrimitiveTypes :  
    t : Type -> bool
```

Parameters

t

Type: [System.Type](#)

Type examined

Return Value

Type: [Boolean](#)

true if type does; otherwise false

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [Type](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

TypeExtensions.ToGenericTypeString Method

Gets a string representation of a Type corresponding to how it looks in C# code

Namespace: [VelocityDb.Session](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static string ToGenericTypeString(  
    this Type t,  
    params Type[] arg  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Function ToGenericTypeString (  
    t As Type,  
    ParamArray arg As Type ()  
) As String
```

C++

```
public:  
[ExtensionAttribute]  
static String^ ToGenericTypeString(  
    Type^ t,  
    ... array<Type^>^ arg  
)
```

F#

```
[<ExtensionAttribute>]  
static member ToGenericTypeString :  
    t : Type *  
    arg : Type[] -> string
```

Parameters

t

Type: [System.Type](#)

The type to get the string for

arg

Type: [System.Type\[\]](#)

Internally used parameter (optional)

Return Value

Type: [String](#)

A string representation of a type

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [Type](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[TypeExtensions Class](#)

[VelocityDb.Session Namespace](#)

VelocityDb.Sync Namespace

The `VelocityDb.Sync` namespace contains classes for enabling data sync between different sets of databases

Classes

| | Class | Description |
|-----------------------------------------------------------------------------------|------------------------------------|----------------------------------------------------------------------------------------|
|  | Change | Used for tracking changes for use with syncing database sessions |
|  | Changes | Keeps track of changes within a set of databases (a federation). Preliminary version. |
|  | ReplicaSync | Contains info of latest transaction synced with databases at a specified host and path |
|  | TransactionChanges | A log of all changes made within a certain transaction. |

Change Class

Used for tracking changes for use with syncing database sessions

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Sync.Change

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class Change : OptimizedPersistable, IComparable<Change>,
    IComparable
```

VB

```
<SerializableAttribute>
Public Class Change
    Inherits OptimizedPersistable
    Implements IComparable(Of Change), IComparable
```

C++

```
[SerializableAttribute]
public ref class Change : public OptimizedPersistable,
    IComparable<Change^>, IComparable
```

F#

```
[<SerializableAttribute>]
type Change =
    class
        inherit OptimizedPersistable
        interface IComparable<Change>
        interface IComparable
    end
```

The **Change** type exposes the following members.

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | We only want this type of object on any page containing this type so don't use pages with other type of objects when placing an object of this type (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |

| | |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
|  DatabaseId | Database number of changed Database |
|  Deleted | Is this a change involving a database/page delete |
|  PageId | Page number of changed Page |
|  Version | Version of page being updated |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | CompareTo(Object) | Compares objects using the object Id (Overrides OptimizedPersistable.CompareTo(Object) .) |
|  | CompareTo(Change) | Compares the current instance with another object of the same type and returns an integer that indicates whether the current instance precedes, follows, or occurs in the same position in the sort order as the other object. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

Change.Change Methods

The [Change](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | CompareTo(Object) | Compares objects using the object Id (Overrides OptimizedPersistable.CompareTo(Object) .) |
|  | CompareTo(Change) | Compares the current instance with another object of the same type and returns an integer that indicates whether the current instance precedes, follows, or occurs in the same position in the sort order as the other object. |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

[Change Class](#)

[VelocityDb.Sync Namespace](#)

Change.CompareTo Method (Object)

Compares objects using the object [Id](#)

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override int CompareTo(  
    Object change  
)
```

VB

```
Public Overrides Function CompareTo (  
    change As Object  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    Object^ change  
) override
```

F#

```
abstract CompareTo :  
    change : Object -> int  
override CompareTo :  
    change : Object -> int
```

Parameters

change

Type: [System.Object](#)

[Missing <param name="change"/> documentation for "M:VelocityDb.Sync.Change.CompareTo(System.Object)"]

Return Value

Type: [Int32](#)

A value that indicates the relative order of the objects being compared. The return value has these meanings: Value Meaning Less than zero This instance precedes *obj* in the sort order. Zero This instance occurs in the same position in the sort order as *obj*. Greater than zero This instance follows *obj* in the sort order.

Implements

[IComparable.CompareTo\(Object\)](#)

[IComparable.CompareTo\(Object\)](#)

Exceptions

| Exception | Condition |
|-----------------------------------|------------------------------------------------------|
| ArgumentException | <i>obj</i> is not the same type as this instance. |

Change.CompareTo Method (Change)

Compares the current instance with another object of the same type and returns an integer that indicates whether the current instance precedes, follows, or occurs in the same position in the sort order as the other object.

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int CompareTo(  
    Change change  
)
```

VB

```
Public Function CompareTo (  
    change As Change  
) As Integer
```

C++

```
public:  
virtual int CompareTo(  
    Change^ change  
) sealed
```

F#

```
abstract CompareTo :  
    change : Change -> int  
override CompareTo :  
    change : Change -> int
```

Parameters

change

Type: [VelocityDb.Sync.Change](#)

[Missing <param name="change"/> documentation for "M:VelocityDb.Sync.Change.CompareTo(VelocityDb.Sync.Change)"]

Return Value

Type: [Int32](#)

A value that indicates the relative order of the objects being compared. The return value has these meanings: Value Meaning Less than zero This instance precedes *other* in the sort order. Zero This instance occurs in the same position in the sort order as *other*. Greater than zero This instance follows *other* in the sort order.

[CompareTo Overload](#)

[VelocityDb.Sync Namespace](#)

Changes Class

Keeps track of changes within a set of databases (a federation). Preliminary version.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Sync.Changes

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class Changes : OptimizedPersistable
```

VB

```
Public Class Changes
    Inherits OptimizedPersistable
```

C++

```
public ref class Changes : public OptimizedPersistable
```

F#

```
type Changes =
    class
        inherit OptimizedPersistable
    end
```

The **Changes** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|---------------------------------------------------------------------|
|  | ChangeList | A list of TransactionChanges made to the federation |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase) .) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Changes.ChangeList Property

A list of [TransactionChanges](#) made to the federation

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public WeakReferenceList<TransactionChanges> ChangeList { get; }
```

VB

```
Public ReadOnly Property ChangeList As WeakReferenceList(Of  
TransactionChanges)  
    Get
```

C++

```
public:  
property WeakReferenceList<TransactionChanges^>^ ChangeList {  
    WeakReferenceList<TransactionChanges^>^ get ();  
}
```

F#

```
member ChangeList : WeakReferenceList<TransactionChanges> with get
```

Property Value

Type: [WeakReferenceList\(TransactionChanges\)](#)

[VelocityDb.Sync Namespace](#)

Changes.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

[Changes Class](#)

[VelocityDb.Sync Namespace](#)

ReplicaSync Class

Contains info of latest transaction synced with databases at a specified host and path

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.Sync.ReplicaSync

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class ReplicaSync : OptimizedPersistable
```

VB

```
Public Class ReplicaSync
    Inherits OptimizedPersistable
```

C++

```
public ref class ReplicaSync : public OptimizedPersistable
```

F#

```
type ReplicaSync =
    class
        inherit OptimizedPersistable
    end
```

The **ReplicaSync** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|-------------------------|
|  | ReplicaSync | Creates sync log object |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------|-------------------------------------|
|  | SyncFromHost | Host of databases synced with |
|  | SyncFromPath | Path to databases synced with |
|  | TransactionNumber | Last transaction number synced with |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

ReplicaSync Constructor

Creates sync log object

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ReplicaSync(  
    SessionBase syncFromSession,  
    ulong transaction  
)
```

VB

```
Public Sub New (  
    syncFromSession As SessionBase,  
    transaction As ULong  
)
```

C++

```
public:  
ReplicaSync(  
    SessionBase^ syncFromSession,  
    unsigned long long transaction  
)
```

F#

```
new :  
    syncFromSession : SessionBase *  
    transaction : uint64 -> ReplicaSync
```

Parameters

syncFromSession

Type: [VelocityDb.Session.SessionBase](#)

The sync from session

transaction

Type: [System.UInt64](#)

Last transaction synced

ReplicaSync.TransactionNumber Property

Last transaction number synced with

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong TransactionNumber { get; set; }
```

VB

```
Public Property TransactionNumber As ULong  
    Get  
    Set
```

C++

```
public:  
property unsigned long long TransactionNumber {  
    unsigned long long get ();  
    void set (unsigned long long value);  
}
```

F#

```
member TransactionNumber : uint64 with get, set
```

Property Value

Type: [UInt64](#)

VelocityDb.Sync.TransactionChanges

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class TransactionChanges : OptimizedPersistable
```

VB

```
Public Class TransactionChanges
    Inherits OptimizedPersistable
```

C++

```
public ref class TransactionChanges : public OptimizedPersistable
```

F#

```
type TransactionChanges =
    class
        inherit OptimizedPersistable
    end
```

The **TransactionChanges** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------------|-----------------------------------|
|  | ChangeList | List of changes made |
|  | TransactionNumber | Transaction id for these changes. |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase) .) |

Extension Methods

| | Name | Description |

TransactionChanges.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb.Sync](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

[TransactionChanges Class](#)

[VelocityDb.Sync Namespace](#)

VelocityDb.TypeInfo Namespace

The `VelocityDb.TypeInfo` namespace contains classes for Type information of persistently stored data

Classes

| Class | Description |
|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Association | A field attribute that controls what to do when deleting object and other end of association exist. |
|  AutoIncrement | A field attribute that enables a field to get a unique number for each persisted object of a certain type. This only works for objects persisted (directly or indirectly) with Persist(IOptimizedPersistable, Nullable(UInt16)) |
|  CommonTypes | A cache of commonly instantiated Types and their size in bytes |
|  DataMember | Info about a data Field of a persistent object |
|  FieldAccessor | A field attribute that controls how many objects that will be placed on the same page as the object of the field. |
|  ObjectsPerPage | A field attribute that controls how many objects that will be placed on the same page as the object of the field. |
|  Reference | |
|  Relation | The relation classes exist as an aid to maintain referential integrity, that is no dangling references (references to deleted objects). NOTE: These classes may change as they are still in a prototype phase. Let us know how we can improve them? Any ideas are appreciated! |
|  RelationManyToMany(From, To) | Use for many to many relations |
|  RelationOneToMany(From, To) | Use for one to many (and many to one) relations. |
|  RelationOneToOne(From, To) | Use for one to one relations. |
|  Schema | Holds information about persistently stored types. Used internally by VelocityDb. |
|  TypeVersion | Contains info about a version of a VelocityDbType . The info is used when reading/writing an object of the |
|  UseOidShort | Indicates that every field or selected fields of a serializable class should be referenced using a OidShort instead of a full Oid. This means that the referenced object is located in the same database as the object containing the reference. A ShortOid uses less space and references are not tied to a certain database number. |
|  VelocityDbType | Contains persistent info for a Type |

Enumerations

| | Enumeration | Description |
|-----------------------------------------------------------------------------------|------------------------------------------------------|------------------------------------------------------|
|  | Association.ReverseReferenceTypeEnum | What type of reference is used by reverse reference? |

Association Class

A field attribute that controls what to do when deleting object and other end of association exist.

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.TypeInfo.Association

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class Association : Attribute
```

VB

```
Public NotInheritable Class Association
    Inherits Attribute
```

C++

```
public ref class Association sealed : public Attribute
```

F#

```
[<SealedAttribute>]
type Association =
    class
        inherit Attribute
    end
```

The **Association** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------|------------------------------------------------------------|
|  | Association(String) | Initializes a new instance of the Association class |
|  | Association(String, Association.ReverseReferenceTypeEnum) | Initializes a new instance of the Association class |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------------|--------------------------------------------------------------|
|  | ReversePropertyName | Name of property that retrieves other side of association |
|  | ReverseReferenceType | Type of reference to this object at other end of association |

VelocityDB Class Library

[VelocityDb.TypeInfo Namespace](#)

Association Constructor (String)

Initializes a new instance of the [Association](#) class

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Association(  
    string reversePropertyName  
)
```

VB

```
Public Sub New (  
    reversePropertyName As String  
)
```

C++

```
public:  
Association(  
    String^ reversePropertyName  
)
```

F#

```
new :  
    reversePropertyName : string -> Association
```

Parameters

reversePropertyName

Type: [System.String](#)

[Missing <param name="reversePropertyName"/> documentation for "M:VelocityDb.TypeInfo.Association.#ctor(System.String)"]

See Also

[Association Class](#)

[Association Overload](#)

[VelocityDb.TypeInfo Namespace](#)

Association Constructor (String, Association.ReverseReferenceTypeEnum)

Initializes a new instance of the [Association](#) class

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Association(  
    string reversePropertyName,  
    Association.ReverseReferenceTypeEnum reverseReferenceType  
)
```

VB

```
Public Sub New (  
    reversePropertyName As String,  
    reverseReferenceType As Association.ReverseReferenceTypeEnum  
)
```

C++

```
public:  
Association(  
    String^ reversePropertyName,  
    Association.ReverseReferenceTypeEnum reverseReferenceType  
)
```

F#

```
new :  
    reversePropertyName : string *  
    reverseReferenceType : Association.ReverseReferenceTypeEnum ->  
Association
```

Parameters

reversePropertyName

Type: [System.String](#)

[Missing <param name="reversePropertyName"/> documentation for "M:VelocityDb.TypeInfo.Association.#ctor(System.String,VelocityDb.TypeInfo.Association.ReverseReferenceTypeEnum)"]

reverseReferenceType

Type: [VelocityDb.TypeInfo.Association.ReverseReferenceTypeEnum](#)

[Missing <param name="reverseReferenceType"/> documentation for "M:VelocityDb.TypeInfo.Association.#ctor(System.String,VelocityDb.TypeInfo.Association.ReverseReferenceTypeEnum)"]

Association.ReverseReferenceType Property

Type of reference to this object at other end of association

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Association.ReverseReferenceTypeEnum ReverseReferenceType { get; }
```

VB

```
Public ReadOnly Property ReverseReferenceType As  
Association.ReverseReferenceTypeEnum  
Get
```

C++

```
public:  
property Association.ReverseReferenceTypeEnum ReverseReferenceType {  
    Association.ReverseReferenceTypeEnum get ();  
}
```

F#

```
member ReverseReferenceType : Association.ReverseReferenceTypeEnum with get
```

Property Value

Type: [Association.ReverseReferenceTypeEnum](#)

See Also

[Association Class](#)

[VelocityDb.TypeInfo Namespace](#)

Association.ReverseReferenceTypeEnum Enumeration

What type of reference is used by reverse reference?

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public enum ReverseReferenceTypeEnum
```

VB

```
Public Enumeration ReverseReferenceTypeEnum
```

C++

```
public enum class ReverseReferenceTypeEnum
```

F#

```
type ReverseReferenceTypeEnum
```

Members

| Member name | Value | Description |
|-------------|-------|------------------------------------------------|
| ToOne | 0 | A direct reference. |
| InSet | 1 | Reference is within a ISet(T) |
| InList | 2 | Reference is within a IList(T) |
| InArray | 3 | Reference is within a Array |

See Also

[VelocityDb.TypeInfo Namespace](#)

AutoIncrement Class

A field attribute that enables a field to get a unique number for each persisted object of a certain type. This only works for objects persisted (directly or indirectly) with [Persist\(IOptimizedPersistable, Nullable\(UInt16\)\)](#)

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.TypeInfo.AutoIncrement

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class AutoIncrement : Attribute
```

VB

```
Public NotInheritable Class AutoIncrement
    Inherits Attribute
```

C++

```
public ref class AutoIncrement sealed : public Attribute
```

F#

```
[<SealedAttribute>]
type AutoIncrement =
    class
        inherit Attribute
    end
```

The **AutoIncrement** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|--------------------------------------------------------------------------------|
|  | AutoIncrement | Use in class definition preceding a field declaration, i.e. [AutoIncrement(1)] |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------|----------------------------------------------------------------|
|  | Start | Gets the requested start number of the auto increment sequence |

VelocityDB Class Library

See Also

[VelocityDb.TypeInfo Namespace](#)

AutoIncrement Constructor

Use in class definition preceding a field declaration, i.e. [AutoIncrement(1)]

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public AutoIncrement(  
    ushort start = 0  
)
```

VB

```
Public Sub New (  
    Optional start As UShort = 0  
)
```

C++

```
public:  
AutoIncrement(  
    unsigned short start = 0  
)
```

F#

```
new :  
    ?start : uint16  
(* Defaults:  
    let _start = defaultArg start 0  
)  
-> AutoIncrement
```

Parameters

start (Optional)

Type: [System.UInt16](#)

The requested start number of the auto increment sequence. Default is 0 so that first persisted object is assigned number 1, second number 2 and so on.

[VelocityDb.TypeInfo Namespace](#)

AutoIncrement.Start Property

Gets the requested start number of the auto increment sequence

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ulong Start { get; }
```

VB

```
Public ReadOnly Property Start As ULong  
    Get
```

C++

```
public:  
property unsigned long long Start {  
    unsigned long long get ();  
}
```

F#

```
member Start : uint64 with get
```

Property Value

Type: [UInt64](#)

The [UInt64](#) sequence start number.

[System.Object](#)

VelocityDb.TypeInfo.CommonTypes

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static class CommonTypes
```

VB

```
Public NotInheritable Class CommonTypes
```

C++

```
public ref class CommonTypes abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
type CommonTypes = class end
```

The **CommonTypes** type exposes the following members.

Fields

| | Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|--------------------------------------------|
|   | s_sizeOfBoolean | Cache of sizeof(Boolean) |
|   | s_sizeOfByte | Cache of sizeof(Byte) |
|   | s_sizeOfChar | Cache of sizeof(Char) |
|   | s_sizeOfDecimal | Cache of sizeof(Decimal) |
|   | s_sizeOfDouble | Cache of sizeof(Double) |
|   | s_sizeOfInt16 | Cache of sizeof(Int16) |

| | |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
|  s_sizeOfInt32  | Cache of sizeof(Int32) |
|  s_sizeOfInt64  | Cache of sizeof(Int64) |
|  s_sizeOfSByte  | Cache of sizeof(SByte) |
|  s_sizeOfSingle  | Cache of sizeof(Single) |
|  s_sizeOfUInt16  | Cache of sizeof(UInt16) |
|  s_sizeOfUInt32  | Cache of sizeof(UInt32) |
|  s_sizeOfUInt64  | Cache of sizeof(UInt64) |
|  s_typeOfArray  | Cache of typeof(Array) |
|  s_typeOfArrayList  | Cache of typeof(ArrayList) |
|  s_typeOfBoolean  | Cache of typeof(Boolean) |
|  s_typeOfBTreeInternal  | Cache of typeof(BTreeInternal(Key, Value)) |
|  s_typeOfBTreeInternalOidShort  | Cache of typeof(BTreeInternalOidShort) |
|  s_typeOfBTreeLeaf  | Cache of typeof(BTreeLeaf(Key, Value)) |
|  s_typeOfBTreeLeafBase  | Cache of typeof(BTreeLeafBase(Key, Value)) |
|  s_typeOfBTreeLeafOidShort  | Cache of typeof(BTreeLeafOidShort) |
|  s_typeOfBTreeMap  | Cache of typeof(BTreeMap(Key, Value)) |
|  s_typeOfBTreeMapOidShort  | Cache of typeof(BTreeMapOidShort(Key, Value)) |
|  s_typeOfBTreeSet  | Cache of typeof(BTreeSet(Key)) |
|  s_typeOfBTreeSetOidShort  | Cache of typeof(BTreeSetOidShort(Key)) |
|  s_typeOfByte  | Cache of typeof(Byte) |

| | |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
|  s_typeofByteArray  | Cache of typeof(Byte[]) |
|  s_typeofChar  | Cache of typeof(Char) |
|  s_typeofCompareByFieldIndex  | Cache of typeof(CompareByFieldIndex(Key)) |
|  s_typeofDataForISerializable  | Cache of typeof(DataForISerializable) |
|  s_typeofDateTime  | Cache of typeof(DateTime) |
|  s_typeofDecimal  | Cache of typeof(Decimal) |
|  s_typeofDelegate  | Cache of typeof(Delegate) |
|  s_typeofDouble  | Cache of typeof(Double) |
|  s_typeofEmbed  | Cache of typeof(Embed) |
|  s_typeofFunc  | Cache of typeof(Func{}) |
|  s_typeofGetHandler  | Cache of typeof(Func(object, object);) |
|  s_typeofGuid  | Cache of typeof(Guid) |
|  s_typeofIndex  | Cache of typeof(Index) |
|  s_typeofIndexStringByHashCode  | Cache of typeof(IndexStringByHashCode) |
|  s_typeofInt16  | Cache of typeof(Int16) |
|  s_typeofInt32  | Cache of typeof(Int32) |
|  s_typeofInt64  | Cache of typeof(Int64) |
|  s_typeofIOptimizedPersistable  | Cache of typeof(IOptimizedPersistable) |
|  s_typeofISet  | Cache of typeof(ISet(T)) |
|  s_typeofList  | Cache of typeof(List{}) |

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
|  s_typeOfLong  | Cache of typeof(Int64) |
|  s_typeOfNonSerializedAttribute  | Cache of typeof(NonSerializedAttribute) |
|  s_typeOfNullable  | Cache of typeof(Nullable) |
|  s_typeOfObject  | Cache of typeof(Object) |
|  s_typeOfObjectActivator  | Cache of typeof(ObjectActivator) |
|  s_typeOfObjectArray  | Cache of typeof(Object []) |
|  s_typeOfOid  | Cache of typeof(Oid) |
|  s_typeOfOidShort  | Cache of typeof(OidShort) |
|  s_typeOfOnePerDatabase  | Cache of typeof(OnePerDatabase) |
|  s_typeOfOptimizedPersistable  | Cache of typeof(OptimizedPersistable) |
|  s_typeOfSByte  | Cache of typeof(SByte) |
|  s_typeOfSchema  | Cache of typeof(Schema) |
|  s_typeOfSessionBase  | Cache of typeof(SessionBase) |
|  s_typeOfSetHandler  | Cache of typeof(Action {object, object}); |
|  s_typeOfSingle  | Cache of typeof(Single) |
|  s_typeOfString  | Cache of typeof(String) |
|  s_typeOfStringArray  | Cache of typeof(String []) |
|  s_typeOfTimeSpan  | Cache of typeof(TimeSpan) |
|  s_typeOfType  | Cache of typeof(Type) |
|  s_typeOfTypeArray  | Cache of typeof(Type []) |

| | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
|  s_typeofTypeVersionArray  | Cache of typeof(TypeVersion[]) |
|  s_typeofUInt16  | Cache of typeof(UInt16) |
|  s_typeofUInt32  | Cache of typeof(UInt32) |
|  s_typeofUInt64  | Cache of typeof(UInt64) |
|  s_typeofUniqueConstraint  | Cache of typeof(UniqueConstraint) |
|  s_typeofUseOidShort  | Cache of typeof(UseOidShort) |
|  s_typeofValueType  | Cache of typeof(ValueType) |
|  s_typeofVelocityDbComparer  | Cache of typeof(VelocityDbComparer(Key)) |
|  s_typeofVelocityDbList  | Cache of typeof(VelocityDbList(T)) |
|  s_typeofVelocityDbListOidShort  | Cache of typeof(VelocityDbListOidShort(T)) |
|  s_typeofWeakIOptimizedPersistableReference  | Cache of typeof(WeakIOptimizedPersistableReference) |
|  s_typeofWeakIOptimizedPersistableReferenceBase  | Cache of typeof(WeakIOptimizedPersistableReferenceBase) |
|  s_typeofWeakReferenceList  | Cache of typeof(WeakReferenceList(T)) |
|  s_typeofWeakShortReferenceList  | Cache of typeof(WeakShortReferenceList(T)) |

CommonTypes.CommonTypes Fields

The [CommonTypes](#) type exposes the following members.

Fields

| Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
|  s_sizeOfBoolean  | Cache of sizeof(Boolean) |
|  s_sizeOfByte  | Cache of sizeof(Byte) |
|  s_sizeOfChar  | Cache of sizeof(Char) |
|  s_sizeOfDecimal  | Cache of sizeof(Decimal) |
|  s_sizeOfDouble  | Cache of sizeof(Double) |
|  s_sizeOfInt16  | Cache of sizeof(Int16) |
|  s_sizeOfInt32  | Cache of sizeof(Int32) |
|  s_sizeOfInt64  | Cache of sizeof(Int64) |
|  s_sizeOfSByte  | Cache of sizeof(SByte) |
|  s_sizeOfSingle  | Cache of sizeof(Single) |
|  s_sizeOfUInt16  | Cache of sizeof(UInt16) |
|  s_sizeOfUInt32  | Cache of sizeof(UInt32) |
|  s_sizeOfUInt64  | Cache of sizeof(UInt64) |
|  s_typeofArray  | Cache of typeof(Array) |
|  s_typeofArrayList  | Cache of typeof(ArrayList) |
|  s_typeofBoolean  | Cache of typeof(Boolean) |
|  s_typeofBTreeInternal  | Cache of typeof(BTreeInternal(Key, Value)) |

| | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
|  s_typeOfBTreeInternalOidShort  | Cache of typeof(BTreeInternalOidShort) |
|  s_typeOfBTreeLeaf  | Cache of typeof(BTreeLeaf(Key, Value)) |
|  s_typeOfBTreeLeafBase  | Cache of typeof(BTreeLeafBase(Key, Value)) |
|  s_typeOfBTreeLeafOidShort  | Cache of typeof(BTreeLeafOidShort) |
|  s_typeOfBTreeMap  | Cache of typeof(BTreeMap(Key, Value)) |
|  s_typeOfBTreeMapOidShort  | Cache of typeof(BTreeMapOidShort(Key, Value)) |
|  s_typeOfBTreeSet  | Cache of typeof(BTreeSet(Key)) |
|  s_typeOfBTreeSetOidShort  | Cache of typeof(BTreeSetOidShort(Key)) |
|  s_typeOfByte  | Cache of typeof(Byte) |
|  s_typeOfByteArray  | Cache of typeof(Byte[]) |
|  s_typeOfChar  | Cache of typeof(Char) |
|  s_typeOfCompareByFieldIndex  | Cache of typeof(CompareByFieldIndex(Key)) |
|  s_typeOfDataForISerializable  | Cache of typeof(DataForISerializable) |
|  s_typeOfDateTime  | Cache of typeof(DateTime) |
|  s_typeOfDecimal  | Cache of typeof(Decimal) |
|  s_typeOfDelegate  | Cache of typeof(Delegate) |
|  s_typeOfDouble  | Cache of typeof(Double) |
|  s_typeOfEmbed  | Cache of typeof(Embed) |
|  s_typeOfFunc  | Cache of typeof(Func{}) |
|  s_typeOfGetHandler  | Cache of typeof(Func{object, object}); |

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
|  s_typeofGuid  | Cache of typeof(Guid) |
|  s_typeofIndex  | Cache of typeof(Index) |
|  s_typeofIndexStringByHashCode  | Cache of typeof(IndexStringByHashCode) |
|  s_typeofInt16  | Cache of typeof(Int16) |
|  s_typeofInt32  | Cache of typeof(Int32) |
|  s_typeofInt64  | Cache of typeof(Int64) |
|  s_typeofIOptimizedPersistable  | Cache of typeof(IOptimizedPersistable) |
|  s_typeofISet  | Cache of typeof(ISet(T)) |
|  s_typeofList  | Cache of typeof(List{}) |
|  s_typeofLong  | Cache of typeof(Int64) |
|  s_typeofNonSerializedAttribute  | Cache of typeof(NonSerializedAttribute) |
|  s_typeofNullable  | Cache of typeof(Nullable) |
|  s_typeofObject  | Cache of typeof(Object) |
|  s_typeofObjectActivator  | Cache of typeof(ObjectActivator) |
|  s_typeofObjectArray  | Cache of typeof(Object[]) |
|  s_typeofOid  | Cache of typeof(Oid) |
|  s_typeofOidShort  | Cache of typeof(OidShort) |
|  s_typeofOnePerDatabase  | Cache of typeof(OnePerDatabase) |
|  s_typeofOptimizedPersistable  | Cache of typeof(OptimizedPersistable) |
|  s_typeofSByte  | Cache of typeof(SByte) |

| | |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
|  s_typeOfSchema  | Cache of typeof(Schema) |
|  s_typeOfSessionBase  | Cache of typeof(SessionBase) |
|  s_typeOfSetHandler  | Cache of typeof(Action{object, object}); |
|  s_typeOfSingle  | Cache of typeof(Single) |
|  s_typeOfString  | Cache of typeof(String) |
|  s_typeOfStringArray  | Cache of typeof(String[]) |
|  s_typeOfTimeSpan  | Cache of typeof(TimeSpan) |
|  s_typeOfType  | Cache of typeof(Type) |
|  s_typeOfTypeArray  | Cache of typeof(Type[]) |
|  s_typeOfTypeVersionArray  | Cache of typeof(TypeVersion[]) |
|  s_typeOfUInt16  | Cache of typeof(UInt16) |
|  s_typeOfUInt32  | Cache of typeof(UInt32) |
|  s_typeOfUInt64  | Cache of typeof(UInt64) |
|  s_typeOfUniqueConstraint  | Cache of typeof(UniqueConstraint) |
|  s_typeOfUseOidShort  | Cache of typeof(UseOidShort) |
|  s_typeOfValueType  | Cache of typeof(ValueType) |
|  s_typeOfVelocityDbComparer  | Cache of typeof(VelocityDbComparer(Key)) |
|  s_typeOfVelocityDbList  | Cache of typeof(VelocityDbList(T)) |
|  s_typeOfVelocityDbListOidShort  | Cache of typeof(VelocityDbListOidShort(T)) |
|  s_typeOfWeakIOptimizedPersistableReference  | Cache of typeof(WeakIOptimizedPersistableReference) |

VelocityDB Class Library

| | |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
|  s_typeofWeakIOptimizedPersistableReferenceBase  se | Cache of typeof(WeakIOptimizedPersistableReferenceBase) |
|  s_typeofWeakReferenceList  | Cache of typeof(WeakReferenceList(T)) |
|  s_typeofWeakShortReferenceList  | Cache of typeof(WeakShortReferenceList(T)) |

VelocityDb.TypeInfo.DataMember

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class DataMember : OptimizedPersistable, IEquatable<DataMember>
```

VB

```
<SerializableAttribute>
Public Class DataMember
    Inherits OptimizedPersistable
    Implements IEquatable(Of DataMember)
```

C++

```
[SerializableAttribute]
public ref class DataMember : public OptimizedPersistable,
    IEquatable<DataMember^>
```

F#

```
[<SerializableAttribute>]
type DataMember =
    class
        inherit OptimizedPersistable
        interface IEquatable<DataMember>
    end
```

The **DataMember** type exposes the following members.

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |

| | |
|--------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
|  Field | The managed field |
|  FieldName | Name of managed field |
|  FieldType | Declared Type of this field |
|  GetTypeCode | Get the type code for a field |
|  HasId | Does this field have an Oid? |
|  IsGuid | true if field is of type Guid |
|  IsInterface | true if field is if type interface |
|  WeakIOptimizedPersistableReference | Is this field a VelocityDb.WeakIOptimizedPersistableReference |

Methods

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  DecodeToArray  | Used by code generator for reading objects. |
|  DecodeToString  | Used by code generator. |
|  Equals | Determines whether two DataMember instances are equal. |
|  GetField | Get FieldInfo for the fields VelocityDB cares about |
|  GetMemberValue | Gets the value of a member within a specified object |
|  GetTypeFromAnyAssemblyVersion  | Load type using GetType(String) , and if fails, attempt to load same type from an assembly by assembly name, without specifying assembly version or any other part of the signature |
|  InitializeAfterRead | Sets up some transient fields (Overrides OptimizedPersistable.InitializeAfterRead(SessionBase) .) |
|  isNull  | Determines if given bytes represents null |
|  isShortOidNull  | Determines if given bytes represent a null short reference |
|  ReadMe | Used by code generator (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean) .) |
|  SetMemberValue | Sets the value of a field within an object |
|  SetMemberValueWithPossibleConvert | Internal Use and in VelocityDBExtensions |
|  StringToType  | Used by code generator. |

VelocityDB Class Library

| | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
|  ToString | Override to provide more internal info in browser (Overrides OptimizedPersistable.ToString().) |
|  TypeToString  | Converts a type to a string the way VelocityDB represents it internally |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

DataMember.DecodeToArray Method

Used by code generator for reading objects.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static Object DecodeToArray(
    byte[] memberBytes,
    Type type,
    ref int offset,
    IOptimizedPersistable o,
    Page page,
    bool useOidShort,
    bool openRefs,
    Schema schema,
    SessionBase session,
    List<IOptimizedPersistable> toLoadMembers,
    int graphDepth,
    int graphDepthToLoad,
    bool primitivesOnly,
    bool embed
)
```

VB

```
Public Shared Function DecodeToArray (
    memberBytes As Byte(),
    type As Type,
    ByRef offset As Integer,
    o As IOptimizedPersistable,
    page As Page,
    useOidShort As Boolean,
    openRefs As Boolean,
    schema As Schema,
    session As SessionBase,
    toLoadMembers As List(Of IOptimizedPersistable),
    graphDepth As Integer,
    graphDepthToLoad As Integer,
    primitivesOnly As Boolean,
    embed As Boolean
) As Object
```

C++

```
public:
static Object^ DecodeToArray(
    array<unsigned char>^ memberBytes,
    Type^ type,
    int% offset,
    IOptimizedPersistable^ o,
    Page^ page,
```

```
bool useOidShort,  
bool openRefs,  
Schema^ schema,  
SessionBase^ session,  
List<IOptimizedPersistable^>^ toLoadMembers,  
int graphDepth,  
int graphDepthToLoad,  
bool primitivesOnly,  
bool embed  
)
```

F#

```
static member DecodeToArray :  
    memberBytes : byte[] *  
    type : Type *  
    offset : int byref *  
    o : IOptimizedPersistable *  
    page : Page *  
    useOidShort : bool *  
    openRefs : bool *  
    schema : Schema *  
    session : SessionBase *  
    toLoadMembers : List<IOptimizedPersistable> *  
    graphDepth : int *  
    graphDepthToLoad : int *  
    primitivesOnly : bool *  
    embed : bool -> Object
```

Parameters

memberBytes

Type: [System.Byte\[\]](#)

Bytes of the object to be read

type

Type: [System.Type](#)

The [Type](#) of the array.

offset

Type: [System.Int32](#)

Current offset into array of bytes

o

Type: [VelocityDb.IOptimizedPersistable](#)

Object containing the array

page

Type: [VelocityDb.Page](#)

The [Page](#) that the array belongs to.

useOidShort

VelocityDB Class Library

Type: [System.Boolean](#)

Use short id (page-slot) for object references

openRefs

Type: [System.Boolean](#)

Open referenced objects?

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active [Schema](#)

session

Type: [VelocityDb.Session.SessionBase](#)

The active session to use

toLoadMembers

Type: [System.Collections.Generic.List\(IOptimizedPersistable\)](#)

Keeps track of fields to load

graphDepth

Type: [System.Int32](#)

Current graph depth

graphDepthToLoad

Type: [System.Int32](#)

How many levels to load

primitivesOnly

Type: [System.Boolean](#)

Load only primitive fields>

embed

Type: [System.Boolean](#)

[Missing <param name="embed"/> documentation for

"M:VelocityDb.TypeInfo.DataMember.DecodeToArray(System.Byte[],System.Type,System.Int32@,VelocityDb.IOptimizedPersistable,VelocityDb.Page,System.Boolean,System.Boolean,VelocityDb.TypeInfo.Schema,VelocityDb.Session.SessionBase,System.Collections.Generic.List{VelocityDb.IOptimizedPersistable},System.Int32,System.Int32,System.Boolean,System.Boolean)"]

Return Value

Type: [Object](#)

The decoded array

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.DecodeToString Method

Used by code generator.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static string DecodeToString(  
    byte[] member,  
    ref int offset,  
    int numberOfBytes  
)
```

VB

```
Public Shared Function DecodeToString (  
    member As Byte(),  
    ByRef offset As Integer,  
    numberOfBytes As Integer  
) As String
```

C++

```
public:  
static String^ DecodeToString(  
    array<unsigned char>^ member,  
    int% offset,  
    int numberOfBytes  
)
```

F#

```
static member DecodeToString :  
    member : byte[] *  
    offset : int byref *  
    numberOfBytes : int -> string
```

Parameters

member

Type: [System.Byte\[\]](#)

Bytes for an object field

offset

Type: [System.Int32](#)

Offset into bytes

numberOfBytes

Type: [System.Int32](#)

Length of field

VelocityDB Class Library

Return Value

Type: [String](#)

A string representing the field value

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.Equals Method

Determines whether two [DataMember](#) instances are equal.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Equals(  
    DataMember other  
)
```

VB

```
Public Function Equals (  
    other As DataMember  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    DataMember^ other  
) sealed
```

F#

```
abstract Equals :  
    other : DataMember -> bool  
override Equals :  
    other : DataMember -> bool
```

Parameters

other

Type: [VelocityDb.TypeInfo.DataMember](#)

The object to compare with the current object.

Return Value

Type: [Boolean](#)

true if the specified [DataMember](#) is equal to the current [DataMember](#); otherwise, false.

Implements

[IEquatable\(T\).Equals\(T\)](#)

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.GetField Method

Get [FieldInfo](#) for the fields VelocityDB cares about

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public FieldInfo GetField(  
    Type t  
)
```

VB

```
Public Function GetField (  
    t As Type  
) As FieldInfo
```

C++

```
public:  
FieldInfo^ GetField(  
    Type^ t  
)
```

F#

```
member GetField :  
    t : Type -> FieldInfo
```

Parameters

t

Type: [System.Type](#)

The type we are requesting it for

Return Value

Type: [FieldInfo](#)

[FieldInfo](#) for the fields VelocityDB cares about

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.GetMemberValue Method

Gets the value of a member within a specified object

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Object GetMemberValue (
    Object obj
)
```

VB

```
Public Function GetMemberValue (
    obj As Object
) As Object
```

C++

```
public:
Object^ GetMemberValue (
    Object^ obj
)
```

F#

```
member GetMemberValue :
    obj : Object -> Object
```

Parameters

obj

Type: [System.Object](#)

The object containing the field

Return Value

Type: [Object](#)

The value of the field

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.GetTypeFromAnyAssemblyVersion Method

Load type using [GetType\(String\)](#), and if fails, attempt to load same type from an assembly by assembly name, without specifying assembly version or any other part of the signature

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static Type GetTypeFromAnyAssemblyVersion(  
    string typeName  
)
```

VB

```
Public Shared Function GetTypeFromAnyAssemblyVersion (  
    typeName As String  
) As Type
```

C++

```
public:  
static Type^ GetTypeFromAnyAssemblyVersion(  
    String^ typeName  
)
```

F#

```
static member GetTypeFromAnyAssemblyVersion :  
    typeName : string -> Type
```

Parameters

typeName

Type: [System.String](#)

The assembly-qualified name of the type to get. See [System.Type.AssemblyQualifiedName](#). If the type is in the currently executing assembly or in Mscorlib.dll, it is sufficient to supply the type name qualified by its namespace.

Return Value

Type: [Type](#)

A [Type](#) as decoded from [String](#).

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.InitializeAfterRead Method

Sets up some transient fields

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRead(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRead (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRead(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRead :  
    session : SessionBase -> unit  
override InitializeAfterRead :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object.

Implements

[IOptimizedPersistable.InitializeAfterRead\(SessionBase\)](#)

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.isNull Method

Determines if given bytes represents null

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool isNull(  
    byte[] memberBytes,  
    int offset  
)
```

VB

```
Public Shared Function isNull (  
    memberBytes As Byte(),  
    offset As Integer  
) As Boolean
```

C++

```
public:  
static bool isNull(  
    array<unsigned char>^ memberBytes,  
    int offset  
)
```

F#

```
static member isNull :  
    memberBytes : byte[] *  
    offset : int -> bool
```

Parameters

memberBytes

Type: [System.Byte\[\]](#)

bytes to check

offset

Type: [System.Int32](#)

offset into bytes

Return Value

Type: [Boolean](#)

true if bytes represent null; otherwise false

See Also

[DataMember Class](#)

DataMember.isShortOidNull Method

Determines if given bytes represent a null short reference

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static bool isShortOidNull(  
    byte[] memberBytes,  
    int offset  
)
```

VB

```
Public Shared Function isShortOidNull (  
    memberBytes As Byte(),  
    offset As Integer  
) As Boolean
```

C++

```
public:  
static bool isShortOidNull(  
    array<unsigned char>^ memberBytes,  
    int offset  
)
```

F#

```
static member isShortOidNull :  
    memberBytes : byte[] *  
    offset : int -> bool
```

Parameters

memberBytes

Type: [System.Byte\[\]](#)

bytes to check

offset

Type: [System.Int32](#)

offset into bytes

Return Value

Type: [Boolean](#)

true if bytes represent null; otherwise false

[DataMember Class](#)

VelocityDB Class Library

[VelocityDb.TypeInfo Namespace](#)

DataMember.ReadMe Method

Used by code generator

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void ReadMe (
    TypeVersion typeVersion,
    byte[] memberBytes,
    ref int offset,
    SessionBase session,
    Page page,
    bool useOidShort,
    Schema schema,
    bool openRefs,
    List<IOptimizedPersistable> toLoadMembers,
    int graphDepth,
    int graphDepthToLoad,
    bool primitivesOnly
)
```

VB

```
Public Overrides Sub ReadMe (
    typeVersion As TypeVersion,
    memberBytes As Byte(),
    ByRef offset As Integer,
    session As SessionBase,
    page As Page,
    useOidShort As Boolean,
    schema As Schema,
    openRefs As Boolean,
    toLoadMembers As List(Of IOptimizedPersistable),
    graphDepth As Integer,
    graphDepthToLoad As Integer,
    primitivesOnly As Boolean
)
```

C++

```
public:
virtual void ReadMe (
    TypeVersion^ typeVersion,
    array<unsigned char>^ memberBytes,
    int% offset,
    SessionBase^ session,

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.SetMemberValue Method

Sets the value of a field within an object

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SetMemberValue (  
    Object obj,  
    Object value  
)
```

VB

```
Public Sub SetMemberValue (  
    obj As Object,  
    value As Object  
)
```

C++

```
public:  
void SetMemberValue (  
    Object^ obj,  
    Object^ value  
)
```

F#

```
member SetMemberValue :  
    obj : Object *  
    value : Object -> unit
```

Parameters

obj

Type: [System.Object](#)

Object to set field value for

value

Type: [System.Object](#)

The field value

See Also

[DataMember Class](#)

[VelocityDb.TypeInfo Namespace](#)

DataMember.SetMemberValueWithPossibleConvert Method

Internal Use and in VelocityDBExtensions

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

```
C#  
public void SetMemberValueWithPossibleConvert (  
    Object obj,  
    Object value  
)
```

```
VB  
Public Sub SetMemberValueWithPossibleConvert (  
    obj As Object,  
    value As Object  
)
```

```
C++  
public:  
void SetMemberValueWithPossibleConvert (  
    Object^ obj,  
    Object^ value  
)
```

```
F#  
member SetMemberValueWithPossibleConvert :  
    obj : Object *  
    value : Object -> unit
```

Parameters

obj

Type: [System.Object](#)

Object for which to set a value

value

Type: [System.Object](#)

Value to set to

DataMember.StringToType Method

Used by code generator.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public static Type StringToType(  
    string typeAsString,  
    SessionBase session,  
    out bool typeUpdated  
)
```

VB

```
Public Shared Function StringToType (  
    typeAsString As String,  
    session As SessionBase,  
    <OutAttribute> ByRef typeUpdated As Boolean  
) As Type
```

C++

```
public:  
static Type^ StringToType(  
    String^ typeAsString,  
    SessionBase^ session,  
    [OutAttribute] bool% typeUpdated  
)
```

F#

```
static member StringToType :  
    typeAsString : string *  
    session : SessionBase *  
    typeUpdated : bool byref -> Type
```

Parameters

typeAsString

Type: [System.String](#)

A [Type](#) encoded as a [String](#).

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

typeUpdated

Type: [System.Boolean](#)

Was a [Type](#) change detected?

VelocityDB Class Library

Return Value

Type: [Type](#)

Decoded [Type](#).

FieldAccessor Class

A field attribute that controls how many objects that will be placed on the same page as the object of the field.

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.TypeInfo.FieldAccessor

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class FieldAccessor : Attribute
```

VB

```
Public NotInheritable Class FieldAccessor
    Inherits Attribute
```

C++

```
public ref class FieldAccessor sealed : public Attribute
```

F#

```
[<SealedAttribute>]
type FieldAccessor =
    class
        inherit Attribute
    end
```

The **FieldAccessor** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | FieldAccessor | Use in class definition preceding a property declaration, i.e. [FieldAccessor("myProtectedField")] where myProtectedField is the field name of the field returned by the property. |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------|
|  | FieldName | Gets the field name of the field being accessed by the property |

VelocityDB Class Library

[VelocityDb.TypeInfo Namespace](#)

FieldAccessor Constructor

Use in class definition preceding a property declaration, i.e. [FieldAccessor("myProtectedField")] where myProtectedField is the field name of the field returned by the property.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public FieldAccessor(  
    string fieldName  
)
```

VB

```
Public Sub New (  
    fieldName As String  
)
```

C++

```
public:  
FieldAccessor(  
    String^ fieldName  
)
```

F#

```
new :  
    fieldName : string -> FieldAccessor
```

Parameters

fieldName

Type: [System.String](#)

Name of field.

See Also

[FieldAccessor Class](#)

[VelocityDb.TypeInfo Namespace](#)

FieldAccessor.FieldName Property

Gets the field name of the field being accessed by the property

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string FieldName { get; }
```

VB

```
Public ReadOnly Property FieldName As String  
    Get
```

C++

```
public:  
property String^ FieldName {  
    String^ get ();  
}
```

F#

```
member FieldName : string with get
```

Property Value

Type: [String](#)

The name of the field.

ObjectsPerPage Class

A field attribute that controls how many objects that will be placed on the same page as the object of the field.

Inheritance Hierarchy

[System.Object](#)

[System.Attribute](#)

VelocityDb.TypeInfo.ObjectsPerPage

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class ObjectsPerPage : Attribute
```

VB

```
Public NotInheritable Class ObjectsPerPage  
    Inherits Attribute
```

C++

```
public ref class ObjectsPerPage sealed : public Attribute
```

F#

```
[<SealedAttribute>]  
type ObjectsPerPage =  
    class  
        inherit Attribute  
    end
```

The **ObjectsPerPage** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------|---------------------------------------------------------------------------------|
|  | ObjectsPerPage | Use in class definition preceding a field declaration, i.e. [ObjectsPerPage(1)] |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------|----------------------------------------------------------|
|  | LimitPerPage | Gets the requested maximum number of objects on the page |

[VelocityDb.TypeInfo Namespace](#)

ObjectsPerPage Constructor

Use in class definition preceding a field declaration, i.e. [ObjectsPerPage(1)]

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ObjectsPerPage(  
    ushort limitPerPage  
)
```

VB

```
Public Sub New (  
    limitPerPage As UShort  
)
```

C++

```
public:  
ObjectsPerPage(  
    unsigned short limitPerPage  
)
```

F#

```
new :  
    limitPerPage : uint16 -> ObjectsPerPage
```

Parameters

limitPerPage

Type: [System.UInt16](#)

The requested maximum number of objects on the page.

[ObjectsPerPage Class](#)

[VelocityDb.TypeInfo Namespace](#)

ObjectsPerPage.ObjectsPerPage Properties

The [ObjectsPerPage](#) type exposes the following members.

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|------------------------------|----------------------------------------------------------|
|  | LimitPerPage | Gets the requested maximum number of objects on the page |

See Also

[ObjectsPerPage Class](#)

[VelocityDb.TypeInfo Namespace](#)

ObjectsPerPage.LimitPerPage Property

Gets the requested maximum number of objects on the page

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public ushort LimitPerPage { get; }
```

VB

```
Public ReadOnly Property LimitPerPage As UShort  
    Get
```

C++

```
public:  
property unsigned short LimitPerPage {  
    unsigned short get ();  
}
```

F#

```
member LimitPerPage : uint16 with get
```

Property Value

Type: [UInt16](#)

The [UInt16](#) number of objects.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.TypeInfo.Reference

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public class Reference : OptimizedPersistable, IComparable<Reference>
```

VB

```
Public Class Reference
    Inherits OptimizedPersistable
    Implements IComparable(Of Reference)
```

C++

```
public ref class Reference : public OptimizedPersistable,
    IComparable<Reference^>
```

F#

```
type Reference =
    class
        inherit OptimizedPersistable
        interface IComparable<Reference>
    end
```

The **Reference** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------|----------------------------------------------------------|
|  | Reference | Initializes a new instance of the Reference class |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------|-------------------------------------------------|
|  | RefFieldName | Field name in To object that contains reference |
|  | To | Persistent object being referenced |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Reference Constructor

Initializes a new instance of the [Reference](#) class

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Reference (
    IOptimizedPersistable aRef,
    string refFieldName
)
```

VB

```
Public Sub New (
    aRef As IOptimizedPersistable,
    refFieldName As String
)
```

C++

```
public:
Reference (
    IOptimizedPersistable^ aRef,
    String^ refFieldName
)
```

F#

```
new :
    aRef : IOptimizedPersistable *
    refFieldName : string -> Reference
```

Parameters

aRef

Type: [VelocityDb.IOptimizedPersistable](#)

[Missing <param name="aRef"/> documentation for

"M:VelocityDb.TypeInfo.Reference.#ctor(VelocityDb.IOptimizedPersistable,System.String)"]

refFieldName

Type: [System.String](#)

[Missing <param name="refFieldName"/> documentation for

"M:VelocityDb.TypeInfo.Reference.#ctor(VelocityDb.IOptimizedPersistable,System.String)"]

Relation Class

The relation classes exist as an aid to maintain referential integrity, that is no dangling references (references to deleted objects). NOTE: These classes may change as they are still in a prototype phase. Let us know how we can improve them? Any ideas are appreciated!

    String^ toFieldName,  
    SessionBase^ session,  
    BTreeSet<From>^ from = nullptr,  
    BTreeSet<To>^ to = nullptr  
)
```

F#

```
new :  
    fromFieldName : string *  
    toFieldName : string *  
    session : SessionBase *  
    ?from : BTreeSet<'From> *  
    ?to : BTreeSet<'To>  
(* Defaults:  
    let_from = defaultArg from null  
    let_to = defaultArg to null  
)  
-> RelationManyToMany
```

VelocityDB Class Library

Parameters

fromFieldName

Type: [System.String](#)

Field name in from object that references this relation

toFieldName

Type: [System.String](#)

Field name in to object that references this relation

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

from (Optional)

Type: [VelocityDb.Collection.BTree.BTreeSet\(From\)](#)

Collection of From objects. If null, default [BTreeSet\(Key\)](#) is created.

to (Optional)

Type: [VelocityDb.Collection.BTree.BTreeSet\(To\)](#)

Collection of To objects. If null, default is created.

```

Type Parameters

From

Type

of From object

To

[Type](#)

of To object

The RelationOneToMany(From, To) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------|----------------------------------------------------|
|  | RelationOneToMany(From, To) | Creates the relations between From and To objects. |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|--------------------------------------------------------|
|  | FromFieldName | Name of field referencing this object from From object |
|  | RelatedFrom | Gets or sets the From object |
|  | RelatedTo | Returns the To objects |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AddRelationTo | Adds a new relations to a To object. Added to "many" collection. |
|  | RemoveRelationTo | Removes relation to a To object. Removed from "many" collection. |
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase) .) |

Extension Methods

Removes relation to a To object. Removed from "many" collection.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool RemoveRelationTo(  
    To to  
)
```

VB

```
Public Function RemoveRelationTo (  
    to As To  
) As Boolean
```

C++

```
public:  
bool RemoveRelationTo(  
    To to  
)
```

F#

```
member RemoveRelationTo :  
    to : 'To -> bool
```

Parameters

to

Type: *To*

To object to be removed.

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for "M:VelocityDb.TypeInfo.RelationOneToMany`2.RemoveRelationTo(`1)"]

RelationOneToMany(From, To).Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]  
public class RelationOneToOne<From, To> : Relation  
where From : IOptimizedPersistable  
where To : IOptimizedPersistable
```

VB

```
<SerializableAttribute>  
Public Class RelationOneToOne (Of From As IOptimizedPersistable, To As  
IOptimizedPersistable)  
    Inherits Relation
```

C++

```
[SerializableAttribute]  
generic<typename From, typename To>  
where From : IOptimizedPersistable  
where To : IOptimizedPersistable  
public ref class RelationOneToOne : public Relation
```

F#

```
[<SerializableAttribute>]  
type RelationOneToOne<'From, 'To when 'From : IOptimizedPersistable when 'To  
: IOptimizedPersistable> =  
    class  
        inherit Relation  
    end
```

Type Parameters

From

Type of From object

To

Type of To object

The RelationOneToOne(From, To) type exposes the following members.

Constructors

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------------------------|---------------------------------------------------|
|  | RelationOneToOne(From, To) | Creates the relations between From and To objects |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------|--------------------------------------------------------|
|  | FromFieldName | Name of field referencing this object from From object |
|  | RelatedFrom | Returns the From object |
|  | RelatedTo | Returns the To object |
|  | ToFieldName | Name of field referencing this object from To object |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

RelationOneToOne(*From*, *To*) Constructor

Creates the relations between From and To objects

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public RelationOneToOne(  
    From from,  
    To to,  
    string fromFieldName,  
    string toFieldName,  
    SessionBase session  
)
```

VB

```
Public Sub New (  
    from As From,  
    to As To,  
    fromFieldName As String,  
    toFieldName As String,  
    session As SessionBase  
)
```

C++

```
public:  
RelationOneToOne(  
    From from,  
    To to,  
    String^ fromFieldName,  
    String^ toFieldName,  
    SessionBase^ session  
)
```

F#

```
new :  
    from : 'From *  
    to : 'To *  
    fromFieldName : string *  
    toFieldName : string *  
    session : SessionBase -> RelationOneToOne
```

Parameters

from

Type: *From*

From object

to

VelocityDB Class Library

Type: *To*
to object

fromFieldName

Type: [System.String](#)

Field name in from object that references this relation

toFieldName

Type: [System.String](#)

Field name in to object that references this relation

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

Schema Class

Holds information about persistently stored types. Used internally by VelocityDb.

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.TypeInfo.Schema

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class Schema : OptimizedPersistable
```

VB

```
<SerializableAttribute>
Public Class Schema
    Inherits OptimizedPersistable
```

C++

```
[SerializableAttribute]
public ref class Schema : public OptimizedPersistable
```

F#

```
[<SerializableAttribute>]
type Schema =
    class
        inherit OptimizedPersistable
    end
```

The **Schema** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|  | Cache | Do cache CacheEnum.Yes (Overrides OptimizedPersistable.Cache.) |
|  | LookupByType | For use in VelocityDBExtension DLL |

| | |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  TypesByName | All persisted types ordered by Type name |
|  WeakReferencedTypes  | Info about what Type another Type is referencing indirectly via object Id reference or other non explicit/weak reference. If your class persists objects with implicit/weak references to other persisted objects then register this fact by adding to this Dictionary(TKey, TValue) . Information provided by this Dictionary(TKey, TValue) is primarily used by Database Manager Schema Connectivity Window. |

Methods

| Name | Description |
|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  GetTypeVersion | Opens a TypeVersion object |
|  InitializeAfterRecreate | This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data. (Overrides OptimizedPersistable.InitializeAfterRecreate(SessionBase) .) |
|  IsExpandedInternalType | Includes additional build in types |
|  IsInternalType(UInt16) | Determine if a given slot is within the range of slots containing the build in/pre registered types |
|  IsInternalType(VelocityDbType) | Determine if a given VelocityDbType is a build in/pre registered type |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean) .) |
|  RegisterClass | Register a type in the persistent schema |

Fields

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
|  s_bootupTypeCount  | VelocityDB internal schema requires this many slots on schema page |
|  s_bootupTypeCountExpanded  | Additional internal schema added September 9, 2017 |
|  SchemaDB  | |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |

VelocityDB Class Library

| | |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

Schema.GetTypeVersion Method

Opens a [TypeVersion](#) object

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion GetTypeVersion(  
    uint pageSlot,  
    SessionBase session,  
    bool usePersistent = false  
)
```

VB

```
Public Function GetTypeVersion (  
    pageSlot As UInteger,  
    session As SessionBase,  
    Optional usePersistent As Boolean = false  
) As TypeVersion
```

C++

```
public:  
TypeVersion^ GetTypeVersion(  
    unsigned int pageSlot,  
    SessionBase^ session,  
    bool usePersistent = false  
)
```

F#

```
member GetTypeVersion :  
    pageSlot : uint32 *  
    session : SessionBase *  
    ?usePersistent : bool  
(* Defaults:  
    let _usePersistent = defaultArg usePersistent false  
)  
-> TypeVersion
```

Parameters

pageSlot

Type: [System.UInt32](#)

Page and slot of [TypeVersion](#) object

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

VelocityDB Class Library

usePersistent (Optional)

Type: [System.Boolean](#)

Use persisted boot up type or transient one

Return Value

Type: [TypeVersion](#)

A type version

Schema.InitializeAfterRecreate Method

This function is called when an object has been read from disk before all data members (fields) have been fully loaded. Override this to provide your own initializations of transient data.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void InitializeAfterRecreate(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub InitializeAfterRecreate (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void InitializeAfterRecreate(  
    SessionBase^ session  
) override
```

F#

```
abstract InitializeAfterRecreate :  
    session : SessionBase -> unit  
override InitializeAfterRecreate :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The active session managing this object

Implements

[IOptimizedPersistable.InitializeAfterRecreate\(SessionBase\)](#)

See Also

Schema.IsExpandedInternalType Method

Includes additional build in types

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool IsExpandedInternalType (
    ushort slotNumber
)
```

VB

```
Public Function IsExpandedInternalType (
    slotNumber As UShort
) As Boolean
```

C++

```
public:
bool IsExpandedInternalType (
    unsigned short slotNumber
)
```

F#

```
member IsExpandedInternalType :
    slotNumber : uint16 -> bool
```

Parameters

slotNumber

Type: [System.UInt16](#)

slot number of a [VelocityDbType](#) or [TypeVersion](#)

Return Value

Type: [Boolean](#)

true if internal; otherwise false

Schema.RegisterClass Method

Register a type in the persistent schema

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion RegisterClass(
    Type type,
    SessionBase session,
    bool inFlush = false,
    bool persistIt = true
)
```

VB

```
Public Function RegisterClass (
    type As Type,
    session As SessionBase,
    Optional inFlush As Boolean = false,
    Optional persistIt As Boolean = true
) As TypeVersion
```

C++

```
public:
    TypeVersion^ RegisterClass(
        Type^ type,
        SessionBase^ session,
        bool inFlush = false,
        bool persistIt = true
    )
```

F#

```
member RegisterClass :
    type : Type *
    session : SessionBase *
    ?inFlush : bool *
    ?persistIt : bool
(* Defaults:
    let_inFlush = defaultArg inFlush false
    let_persistIt = defaultArg persistIt true
*)
-> TypeVersion
```

Parameters

type

Type: [System.Type](#)

A type to register

VelocityDB Class Library

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

inFlush (Optional)

Type: [System.Boolean](#)

Set to false if you want to avoid page flushing as a side affect

persistIt (Optional)

Type: [System.Boolean](#)

Set to false if getting [TypeVersion](#) for a lookup (object read)

Return Value

Type: [TypeVersion](#)

An existing [TypeVersion](#) or a new one

    class
        inherit OptimizedPersistable
        interface IEquatable<TypeVersion>
    end
```

The **TypeVersion** type exposes the following members.

Properties

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other |

| | | |
|-------------------------------------------------------------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|  | AnyFieldIndex | Does managed type or its base classes include a field index ? |
|  | AnyTypeIndex | Does managed type or its base classes include a type index ? |
|  | AutoIncrement | Does managed type or its base classes include an auto increment field? |
|  | BaseShape | Get the base TypeVersion or null if none exist |
|  | Cache | By default, the an object cache is determined by a SessionBase constructor parameter but certain types of objects may be re opened more frequently than others, for such types override this to return a value. Caching objects this way can cause out of date object references to stay active due to lacking code to invalidate a cached object when referenced objects are replaced. We will add this automatic invalidation as soon as possible but for now use caution when caching objects. Caching objects that does not strongly reference other objects is OK to do. (Overrides OptimizedPersistable.Cache.) |
|  | CountStart | Set where AutoIncrement counter should start |
|  | DataMemberArray | Get an array of fields represented as DataMember . Does not include fields from base classes. |
|  | FieldIndex | Does managed type include a field index ? |
|  | IsFixedSize | A type is fixed size if it only has fixed size fields |
|  | IsSerializable | <code>true</code> if ISerializable otherwise, <code>false</code> . |
|  | IsString | Is this schema for type System.String ? |
|  | IsValueType | Is managed type a ValueType ? |
|  | Type | Get the .NET type of the schema class |
|  | TypeIndex | Does managed type include a type index ? |
|  | VelocityDbType | Get schema class object managing a particular .NET type. |

Methods

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
|  EncodeForCsv | Encode a persistent object as a string for csv export |
|  Equals | Indicates whether the current object is equal to another object of the same type. |
|  GetDataMemberList | Get a list of all DataMember of this type including base classes. |
|  LoadMembers | Loads member fields from persistent storage |
|  ObjectBytesFromStrings | Converts string representation of an object into VelocityDB object byte representation. |

| | |
|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  PersistReferences | Persists references from an object |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  SetCount | |
|  ToString | (Overrides OptimizedPersistable.ToString().) |
|  TotalShapeNumberOfBytes | Get the total size of an object of the managed type (including base class fields) |
|  Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase).) |

Extension Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

TypeVersion.AllowOtherTypesOnSamePage Property

Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool AllowOtherTypesOnSamePage { get; }
```

VB

```
Public Overrides ReadOnly Property AllowOtherTypesOnSamePage As Boolean  
    Get
```

C++

```
public:  
virtual property bool AllowOtherTypesOnSamePage {  
    bool get () override;  
}
```

F#

```
abstract AllowOtherTypesOnSamePage : bool with get  
override AllowOtherTypesOnSamePage : bool with get
```

Property Value

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public VelocityDbType VelocityDbType { get; }
```

VB

```
Public ReadOnly Property VelocityDbType As VelocityDbType  
    Get
```

C++

```
public:  
property VelocityDbType^ VelocityDbType {  
    VelocityDbType^ get ();  
}
```

F#

```
member VelocityDbType : VelocityDbType with get
```

Property Value

Type: [VelocityDbType](#)

TypeVersion.TypeVersion Methods

The [TypeVersion](#) type exposes the following members.

Methods

| Name | Description |
|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  EncodeForCsv | Encode a persistent object as a string for csv export |
|  Equals | Indicates whether the current object is equal to another object of the same type. |
|  GetDataMemberList | Get a list of all DataMember of this type including base classes. |
|  LoadMembers | Loads member fields from persistent storage |
|  ObjectBytesFromStrings | Converts string representation of an object into VelocityDB object byte representation. |
|  PersistRefences | Persists references from an object |
|  ReadMe | (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  SetCount | |
|  ToString | (Overrides OptimizedPersistable.ToString().) |
|  TotalShapeNumberOfBytes | Get the total size of an object of the managed type (including base class fields) |
|  Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase).) |

Extension Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

TypeVersion.EncodeForCsv Method

Encode a persistent object as a string for csv export

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string EncodeForCsv(  
    Object obj,  
    PageInfo pageInfo,  
    SessionBase session  
)
```

VB

```
Public Function EncodeForCsv (  
    obj As Object,  
    pageInfo As PageInfo,  
    session As SessionBase  
) As String
```

C++

```
public:  
String^ EncodeForCsv(  
    Object^ obj,  
    PageInfo^ pageInfo,  
    SessionBase^ session  
)
```

F#

```
member EncodeForCsv :  
    obj : Object *  
    pageInfo : PageInfo *  
    session : SessionBase -> string
```

Parameters

obj

Type: [System.Object](#)

Object to be encoded

pageInfo

Type: [VelocityDb.PageInfo](#)

PageInfo for page where object lives

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

VelocityDB Class Library

Return Value

Type: [String](#)

Object encoded as a string

See Also

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

TypeVersion.Equals Method

Indicates whether the current object is equal to another object of the same type.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public bool Equals(  
    TypeVersion other  
)
```

VB

```
Public Function Equals (  
    other As TypeVersion  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    TypeVersion^ other  
) sealed
```

F#

```
abstract Equals :  
    other : TypeVersion -> bool  
override Equals :  
    other : TypeVersion -> bool
```

Parameters

other

Type: [VelocityDb.TypeInfo.TypeVersion](#)

An object to compare with this object.

Return Value

Type: [Boolean](#)

`true` (`True` in Visual Basic) if the current object is equal to the *other* parameter; otherwise, `false` (`False` in Visual Basic).

Implements

[IEquatable\(T\).Equals\(T\)](#)

See Also

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

TypeVersion.GetDataMemberList Method

Get a list of all [DataMember](#) of this type including base classes.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public List<DataMember> GetDataMemberList ()
```

VB

```
Public Function GetDataMemberList As List(Of DataMember)
```

C++

```
public:  
List<DataMember^>^ GetDataMemberList ()
```

F#

```
member GetDataMemberList : unit -> List<DataMember>
```

Return Value

Type: [List\(DataMember\)](#)

A list of [DataMember](#) that this type or a base class contains

See Also

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

TypeVersion.LoadMembers Method

Loads member fields from persistent storage

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void LoadMembers(  
    IOptimizedPersistable toLoad,  
    Schema schema,  
    List<IOptimizedPersistable> toLoadMembers,  
    int graphDepth,  
    int graphDepthToLoad,  
    SessionBase session,  
    bool primitivesOnly = false  
)
```

VB

```
Public Sub LoadMembers (  
    toLoad As IOptimizedPersistable,  
    schema As Schema,  
    toLoadMembers As List(Of IOptimizedPersistable),  
    graphDepth As Integer,  
    graphDepthToLoad As Integer,  
    session As SessionBase,  
    Optional primitivesOnly As Boolean = false  
)
```

C++

```
public:  
void LoadMembers (  
    IOptimizedPersistable^ toLoad,  
    Schema^ schema,  
    List<IOptimizedPersistable^>^ toLoadMembers,  
    int graphDepth,  
    int graphDepthToLoad,  
    SessionBase^ session,  
    bool primitivesOnly = false  
)
```

F#

```
member LoadMembers :  
    toLoad : IOptimizedPersistable *  
    schema : Schema *  
    toLoadMembers : List<IOptimizedPersistable> *  
    graphDepth : int *  
    graphDepthToLoad : int *  
    session : SessionBase *  
    ?primitivesOnly : bool
```

VelocityDB Class Library

```
(* Defaults:  
    let_primitivesOnly = defaultArg primitivesOnly false  
*)  
-> unit
```

Parameters

toLoad

Type: [VelocityDb.IOptimizedPersistable](#)

Object to load fields for

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The current schema

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

To be loaded fields list

graphDepth

Type: [System.Int32](#)

Current graph depth loaded

graphDepthToLoad

Type: [System.Int32](#)

Max graph depth to load fields for

session

Type: [VelocityDb.Session.SessionBase](#)

The active session

primitivesOnly (Optional)

Type: [System.Boolean](#)

If true, load only primitive values

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

TypeVersion.ObjectBytesFromStrings Method

Converts string representation of an object into VelocityDB object byte representation.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void ObjectBytesFromStrings (
    string[] members,
    string[] fieldNames,
    SessionBase session,
    Schema schema
)
```

VB

```
Public Sub ObjectBytesFromStrings (
    members As String(),
    fieldNames As String(),
    session As SessionBase,
    schema As Schema
)
```

C++

```
public:
void ObjectBytesFromStrings (
    array<String^>^ members,
    array<String^>^ fieldNames,
    SessionBase^ session,
    Schema^ schema
)
```

F#

```
member ObjectBytesFromStrings :
    members : string[] *
    fieldNames : string[] *
    session : SessionBase *
    schema : Schema -> unit
```

Parameters

members

Type: [System.String\[\]](#)

fieldNames

Type: [System.String\[\]](#)

session

Type: [VelocityDb.Session.SessionBase](#)

Active session

VelocityDB Class Library

schema

Type: [VelocityDb.TypeInfo.Schema](#)

Current schema

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

TypeVersion.PersistReferences Method

Persists references from an object

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void PersistReferences (
    Object obj,
    PageInfo pageInfo,
    IOptimizedPersistable owner,
    SessionBase session,
    bool inFlush
)
```

VB

```
Public Sub PersistReferences (
    obj As Object,
    pageInfo As PageInfo,
    owner As IOptimizedPersistable,
    session As SessionBase,
    inFlush As Boolean
)
```

C++

```
public:
void PersistReferences (
    Object^ obj,
    PageInfo^ pageInfo,
    IOptimizedPersistable^ owner,
    SessionBase^ session,
    bool inFlush
)
```

F#

```
member PersistReferences :
    obj : Object *
    pageInfo : PageInfo *
    owner : IOptimizedPersistable *
    session : SessionBase *
    inFlush : bool -> unit
```

Parameters

obj

Type: [System.Object](#)

Object for which we want to persist all references

VelocityDB Class Library

pageInfo

Type: [VelocityDb.PageInfo](#)

PageInfo for page containing the object for which we are persisting references

owner

Type: [VelocityDb.IOptimizedPersistable](#)

Owner object of the object

session

Type: [VelocityDb.Session.SessionBase](#)

Session managing the object

inFlush

Type: [System.Boolean](#)

Are we currently within a page flush

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public void SetCount (
    Object obj,
    AutoPlacement autoPlacement
)
```

VB

```
Public Sub SetCount (
    obj As Object,
    autoPlacement As AutoPlacement
)
```

C++

```
public:
void SetCount (
    Object^ obj,
    AutoPlacement^ autoPlacement
)
```

F#

```
member SetCount :
    obj : Object *
    autoPlacement : AutoPlacement -> unit
```

Parameters

obj

Type: [System.Object](#)

[Missing <param name="obj"/> documentation for

"M:VelocityDb.TypeInfo.TypeVersion.SetCount(System.Object,VelocityDb.AutoPlacement)"]

autoPlacement

Type: [VelocityDb.AutoPlacement](#)

TypeVersion.TotalShapeNumberOfBytes Method

Get the total size of an object of the managed type (including base class fields)

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public int TotalShapeNumberOfBytes (
    Schema schema
)
```

VB

```
Public Function TotalShapeNumberOfBytes (
    schema As Schema
) As Integer
```

C++

```
public:
int TotalShapeNumberOfBytes (
    Schema^ schema
)
```

F#

```
member TotalShapeNumberOfBytes :
    schema : Schema -> int
```

Parameters

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active schema

Return Value

Type: [Int32](#)

The total size of all fields or -1 if fields do not have a fixed size

See Also

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

TypeVersion.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

[TypeVersion Class](#)

[VelocityDb.TypeInfo Namespace](#)

UseOidShort Class

Indicates that every field or selected fields of a serializable class should be referenced using a `OidShort` instead of a full `Oid`. This means that the referenced object is located in the same database as the object containing the reference. A `ShortOid` uses less space and references are not tied to a certain database number.

Inheritance Hierarchy

[System.Attribute](#)

VelocityDb.TypeInfo.UseOidShort

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public sealed class UseOidShort : Attribute
```

VB

```
Public NotInheritable Class UseOidShort  
    Inherits Attribute
```

C++

```
public ref class UseOidShort sealed : public Attribute
```

F#

```
[<SealedAttribute>]  
type UseOidShort =  
    class  
        inherit Attribute  
    end
```

The **UseOidShort** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------|
|  | UseOidShort | Creates the attribute indicating use of <code>OidShort</code> (page + page) |

See Also

[VelocityDb.TypeInfo Namespace](#)

UseOidShort Constructor

Creates the attribute indicating use of OidShort (page + page)

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public UseOidShort ()
```

VB

```
Public Sub New
```

C++

```
public:  
UseOidShort ()
```

F#

```
new : unit -> UseOidShort
```

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDb.TypeInfo.VelocityDbType

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
[SerializableAttribute]
public class VelocityDbType : OptimizedPersistable
```

VB

```
<SerializableAttribute>
Public Class VelocityDbType
    Inherits OptimizedPersistable
```

C++

```
[SerializableAttribute]
public ref class VelocityDbType : public OptimizedPersistable
```

F#

```
[<SerializableAttribute>]
type VelocityDbType =
    class
        inherit OptimizedPersistable
    end
```

The **VelocityDbType** type exposes the following members.

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | AllowOtherTypesOnSamePage | Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types. (Overrides OptimizedPersistable.AllowOtherTypesOnSamePage.) |
|  | Type | Get the type of the schema managed class |
|  | TypeName | Name of Type that this meta object is managing. |

| | | |
|-----------------------------------------------------------------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
|  | TypeVersions | Initially one version exist, if class is modified and UpdateClass(Type) is called other versions can exist. |
|-----------------------------------------------------------------------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------|

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | LastShape | Get the latest version of a schema class |
|  | ReadMe | Used by code generator (Overrides OptimizedPersistable.ReadMe(TypeVersion,Byte[], Int32, SessionBase, Page, Boolean, Schema, Boolean, List(IOptimizedPersistable), Int32, Int32, Boolean).) |
|  | ToString | Displays class name plus object id (Overrides OptimizedPersistable.ToString().) |
|  | Unpersist | Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes. (Overrides OptimizedPersistable.Unpersist(SessionBase).) |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

VelocityDbType.AllowOtherTypesOnSamePage Property

Objects can be stored more efficiently if all object types on the page share the same type. By default mixed types are allowed. Override this to return false for types that should not share pages with other types.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override bool AllowOtherTypesOnSamePage { get; }
```

VB

```
Public Overrides ReadOnly Property AllowOtherTypesOnSamePage As Boolean  
    Get
```

C++

```
public:  
virtual property bool AllowOtherTypesOnSamePage {  
    bool get () override;  
}
```

F#

```
abstract AllowOtherTypesOnSamePage : bool with get  
override AllowOtherTypesOnSamePage : bool with get
```

Property Value

Type: [Boolean](#)

Implements

[IOptimizedPersistable.AllowOtherTypesOnSamePage](#)

See Also

VelocityDbType.Type Property

Get the type of the schema managed class

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public Type Type { get; }
```

VB

```
Public ReadOnly Property Type As Type  
    Get
```

C++

```
public:  
property Type^ Type {  
    Type^ get ();  
}
```

F#

```
member Type : Type with get
```

Property Value

Type: [Type](#)

See Also

[VelocityDbType Class](#)

[VelocityDb.TypeInfo Namespace](#)

VelocityDbType.TypeName Property

Name of [Type](#) that this meta object is managing.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public string TypeName { get; }
```

VB

```
Public ReadOnly Property TypeName As String  
    Get
```

C++

```
public:  
property String^ TypeName {  
    String^ get ();  
}
```

F#

```
member TypeName : string with get
```

Property Value

Type: [String](#)

VelocityDbType.TypeVersions Property

Initially one version exist, if class is modified and [UpdateClass\(Type\)](#) is called other versions can exist.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion[] TypeVersions { get; }
```

VB

```
Public ReadOnly Property TypeVersions As TypeVersion()  
    Get
```

C++

```
public:  
property array<TypeVersion^>^ TypeVersions {  
    array<TypeVersion^>^ get ();  
}
```

F#

```
member TypeVersions : TypeVersion[] with get
```

Property Value

Type: [TypeVersion\[\]](#)

[VelocityDbType Class](#)

[VelocityDb.TypeInfo Namespace](#)

VelocityDbType.LastShape Method

Get the latest version of a schema class

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public TypeVersion LastShape ()
```

VB

```
Public Function LastShape As TypeVersion
```

C++

```
public:  
TypeVersion^ LastShape ()
```

F#

```
member LastShape : unit -> TypeVersion
```

Return Value

Type: [TypeVersion](#)

Current version of a schema class

See Also

VelocityDbType.ReadMe Method

Used by code generator

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void ReadMe (
    TypeVersion typeVersion,
    byte[] memberBytes,
    ref int offset,
    SessionBase session,
    Page page,
    bool useOidShort,
    Schema schema,
    bool openRefs,
    List<IOptimizedPersistable> toLoadMembers,
    int graphDepth,
    int graphDepthToLoad,
    bool primitivesOnly
)
```

VB

```
Public Overrides Sub ReadMe (
    typeVersion As TypeVersion,
    memberBytes As Byte(),
    ByRef offset As Integer,
    session As SessionBase,
    page As Page,
    useOidShort As Boolean,
    schema As Schema,
    openRefs As Boolean,
    toLoadMembers As List(Of IOptimizedPersistable),
    graphDepth As Integer,
    graphDepthToLoad As Integer,
    primitivesOnly As Boolean
)
```

C++

```
public:
virtual void ReadMe (
    TypeVersion^ typeVersion,
    array<unsigned char>^ memberBytes,
    int% offset,
    SessionBase^ session,
    Page^ page,
    bool useOidShort,
    Schema^ schema,
    bool openRefs,
    List<IOptimizedPersistable^>^ toLoadMembers,
```

VelocityDB Class Library

```
    int graphDepth,  
    int graphDepthToLoad,  
    bool primitivesOnly  
) override
```

F#

```
abstract ReadMe :  
    typeVersion : TypeVersion *  
    memberBytes : byte[] *  
    offset : int byref *  
    session : SessionBase *  
    page : Page *  
    useOidShort : bool *  
    schema : Schema *  
    openRefs : bool *  
    toLoadMembers : List<IOptimizedPersistable> *  
    graphDepth : int *  
    graphDepthToLoad : int *  
    primitivesOnly : bool -> unit  
override ReadMe :  
    typeVersion : TypeVersion *  
    memberBytes : byte[] *  
    offset : int byref *  
    session : SessionBase *  
    page : Page *  
    useOidShort : bool *  
    schema : Schema *  
    openRefs : bool *  
    toLoadMembers : List<IOptimizedPersistable> *  
    graphDepth : int *  
    graphDepthToLoad : int *  
    primitivesOnly : bool -> unit
```

Parameters

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

The version of the type being read

memberBytes

Type: [System.Byte\[\]](#)

offset

Type: [System.Int32](#)

session

Type: [VelocityDb.Session.SessionBase](#)

page

Type: [VelocityDb.Page](#)

useOidShort

Type: [System.Boolean](#)

schema

Type: [VelocityDb.TypeInfo.Schema](#)

VelocityDB Class Library

openRefs

Type: [System.Boolean](#)

toLoadMembers

Type: [System.Collections.Generic.List<IOptimizedPersistable>](#)

graphDepth

Type: [System.Int32](#)

graphDepthToLoad

Type: [System.Int32](#)

primitivesOnly

Type: [System.Boolean](#)

Implements

[IOptimizedPersistable.ReadMe\(TypeVersion,Byte\[\], Int32, SessionBase, Page, Boolean, Schema, Boolean, List<IOptimizedPersistable>, Int32, Int32, Boolean\)](#)

See Also

[VelocityDbType Class](#)

VelocityDbType.ToString Method

Displays class name plus object id

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override string ToString()
```

VB

```
Public Overrides Function ToString As String
```

C++

```
public:  
virtual String^ ToString() override
```

F#

```
abstract ToString : unit -> string  
override ToString : unit -> string
```

Return Value

Type: [String](#)

A [String](#) containing class name and object id.

See Also

VelocityDbType.Unpersist Method

Removes an object from the persistent store and makes the object a transient object. It does not automatically make referenced objects unpersisted. Best way to do so is to override this virtual function in your own classes.

Namespace: [VelocityDb.TypeInfo](#)

Assembly: VelocityDb (in VelocityDb.dll) Version: 11.1.0.0 (11.1)

Syntax

C#

```
public override void Unpersist(  
    SessionBase session  
)
```

VB

```
Public Overrides Sub Unpersist (  
    session As SessionBase  
)
```

C++

```
public:  
virtual void Unpersist(  
    SessionBase^ session  
) override
```

F#

```
abstract Unpersist :  
    session : SessionBase -> unit  
override Unpersist :  
    session : SessionBase -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

The managing session

Implements

[IOptimizedPersistable.Unpersist\(SessionBase\)](#)

See Also

Inheritance Hierarchy

[System.Object](#)

VelocityDBExtensions.ImportExportCsv

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static class ImportExportCsv
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class ImportExportCsv
```

C++

```
[ExtensionAttribute]  
public ref class ImportExportCsv abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type ImportExportCsv = class end
```

The **ImportExportCsv** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | ExportToCSV | Export all persistent objects to .csv files, one file for each Type and version of Type. This is preview release, format may change. ImportFromCSV can be used to recreate your data. Note that Microsoft Excel can't handle many of these CSV files due to a field value limitation (at about 33000 chars) Notepad++ is one application that can read these files. Some fields like array data are encoded http://msdn.microsoft.com/en-us/library/dhx0d524(v=vs.110).aspx |
|  | ImportFromCSV | Restores database files, pages and objects from a .csv file data created with ExportToCSV |

static void ExportToCSV(  
    SessionBase^ session,  
    String^ directory  
)
```

F#

```
[<ExtensionAttribute>]  
static member ExportToCSV :  
    session : SessionBase *  
    directory : string -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

the active session

directory

Type: [System.String](#)

Where to store the CSV files

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [SessionBase](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

ImportExportCsv.ImportFromCSV Method

Restores database files, pages and objects from a .csv file data created with ExportToCSV

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static void ImportFromCSV(  
    this SessionBase session,  
    string csvDirectory  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Sub ImportFromCSV (  
    session As SessionBase,  
    csvDirectory As String  
)
```

C++

```
public:  
[ExtensionAttribute]  
static void ImportFromCSV(  
    SessionBase^ session,  
    String^ csvDirectory  
)
```

F#

```
[<ExtensionAttribute>]  
static member ImportFromCSV :  
    session : SessionBase *  
    csvDirectory : string -> unit
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

the active session

csvDirectory

Type: [System.String](#)

Path to directory containing CSV files

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [SessionBase](#). When you use instance method syntax to call this method, omit the first parameter. [<ExtensionAttribute>]
static member ExportToJson :
    session : SessionBase *
    ?includeSubclasses : bool *
    ?databasePerType : bool
(* Defaults:
    let _includeSubclasses = defaultArg includeSubclasses false
    let _databasePerType = defaultArg databasePerType true
*)
-> IEnumerable<string>
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for "M:VelocityDBExtensions.JsonImportExport.ExportToJson`1(VelocityDb.Session.SessionBase,System.Boolean,System.Boolean)"]

includeSubclasses (Optional)

Type: [System.Boolean](#)

[Missing <param name="includeSubclasses"/> documentation for "M:VelocityDBExtensions.JsonImportExport.ExportToJson`1(VelocityDb.Session.SessionBase,System.Boolean,System.Boolean)"]

databasePerType (Optional)

Type: [System.Boolean](#)

[Missing <param name="databasePerType"/> documentation for "M:VelocityDBExtensions.JsonImportExport.ExportToJson`1(VelocityDb.Session.SessionBase,System.Boolean,System.Boolean)"]

Type Parameters

T

[Missing <typeparam name="T"/> documentation for "M:VelocityDBExtensions.JsonImportExport.ExportToJson`1(VelocityDb.Session.SessionBase,System.Boolean,System.Boolean)"]

Return Value

Type: [IEnumerable\(String\)](#)

[Missing <returns> documentation for "M:VelocityDBExtensions.JsonImportExport.ExportToJson`1(VelocityDb.Session.SessionBase,System.Boolean,System.Boolean)"]

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [SessionBase](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

JsonImportExport.ImportJson(T) Method

[Missing <summary> documentation for

"M:VelocityDBExtensions.JsonImportExport.ImportJson`1(VelocityDb.Session.SessionBase,System.String)"]

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static T ImportJson<T>(
    this SessionBase session,
    string json
)
```

VB

```
<ExtensionAttribute>
Public Shared Function ImportJson(Of T) (
    session As SessionBase,
    json As String
) As T
```

C++

```
public:
[ExtensionAttribute]
generic<typename T>
static T ImportJson(
    SessionBase^ session,
    String^ json
)
```

F#

```
[<ExtensionAttribute>]
static member ImportJson :
    session : SessionBase *
    json : string -> 'T
```

Parameters

session

Type: [VelocityDb.Session.SessionBase](#)

[Missing <param name="session"/> documentation for

"M:VelocityDBExtensions.JsonImportExport.ImportJson`1(VelocityDb.Session.SessionBase,System.String)"]

json

Type: [System.String](#)

[Missing <param name="json"/> documentation for

"M:VelocityDBExtensions.JsonImportExport.ImportJson`1(VelocityDb.Session.SessionBase,System.String)"]

Type Parameters

T

[Missing <typeparam name="T"/> documentation for

"M:VelocityDBExtensions.JsonImportExport.ImportJson`1(VelocityDb.Session.SessionBase,System.String)"]

Return Value

Type: **T**

[Missing <returns> documentation for

"M:VelocityDBExtensions.JsonImportExport.ImportJson`1(VelocityDb.Session.SessionBase,System.String)"]

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [SessionBase](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

SyncProvider

KnowledgeSyncProvider

VelocityDBExtensions.SyncProvider

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public class SyncProvider : KnowledgeSyncProvider,  
    IChangeDataRetriever, INotifyingChangeApplierTarget
```

VB

```
Public Class SyncProvider  
    Inherits KnowledgeSyncProvider  
    Implements IChangeDataRetriever, INotifyingChangeApplierTarget
```

C++

```
public ref class SyncProvider : public KnowledgeSyncProvider,  
    IChangeDataRetriever, INotifyingChangeApplierTarget
```

F#

```
type SyncProvider =  
    class  
        inherit KnowledgeSyncProvider  
        interface IChangeDataRetriever  
        interface INotifyingChangeApplierTarget  
    end
```

The **SyncProvider** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|------------------------------|-------------------------------------------------------------|
|  | SyncProvider | Initializes a new instance of the SyncProvider class |

Properties

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------|------------------------------------------------|
|  | IdFormats | (Overrides KnowledgeSyncProvider.IdFormats().) |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | BeginSession | (Overrides KnowledgeSyncProvider.BeginSession(SyncProviderPosition, SyncSessionContext).) |
|  | EndSession | (Overrides KnowledgeSyncProvider.EndSession(SyncSessionContext).) |
|  | Equals | Determines whether the specified object is equal to the current object. (Overrides Object.Equals(Object) .) |
|  | GetChangeBatch | (Overrides KnowledgeSyncProvider.GetChangeBatch(UInt32, SyncKnowledge, Object).) |
|  | GetDataRetriever | |
|  | GetFullEnumerationChangeBatch | (Overrides KnowledgeSyncProvider.GetFullEnumerationChangeBatch(UInt32, SyncId, SyncKnowledge, Object).) |
|  | GetHashCode | Serves as the default hash function. (Overrides Object.GetHashCode() .) |
|  | GetNextTickCount | |
|  | GetSyncBatchParameters | (Overrides KnowledgeSyncProvider.GetSyncBatchParameters(UInt32, SyncKnowledge).) |
|  | LoadChangeData | |
|  | ProcessChangeBatch | (Overrides KnowledgeSyncProvider.ProcessChangeBatch(ConflictResolutionPolicy, ChangeBatch, Object, SyncCallbacks, SyncSessionStatistics).) |
|  | ProcessFullEnumerationChangeBatch | (Overrides KnowledgeSyncProvider.ProcessFullEnumerationChangeBatch(ConflictResolutionPolicy, FullEnumerationChangeBatch, Object, SyncCallbacks, SyncSessionStatistics).) |
|  | SaveChangeWithChangeUnits | |
|  | SaveConflict | |
|  | SaveItemChange | |
|  | StoreKnowledgeForScope | |
|  | ToString | Returns a string that represents the current object. (Overrides Object.ToString() .) |

| | |
|----------------------------------------------------------------------------------------------------------------------------|--|
|  TryGetDestinationVersion | |

    lowerEnumerationBound : SyncId *
    knowledgeForDataRetrieval : SyncKnowledge *
    changeDataRetriever : Object byref -> FullEnumerationChangeBatch
```

Parameters

batchSize

Type: [System.UInt32](#)

[Missing <param name="batchSize"/> documentation for "M:VelocityDBExtensions.SyncProvider.GetFullEnumerationChangeBatch(System.UInt32,Microsoft.Synchronization.SyncId,Microsoft.Synchronization.SyncKnowledge,System.Object@)"]

lowerEnumerationBound

Type: **SyncId**

[Missing <param name="lowerEnumerationBound"/> documentation for "M:VelocityDBExtensions.SyncProvider.GetFullEnumerationChangeBatch(System.UInt32,Microsoft.Synchronization.SyncId,Microsoft.Synchronization.SyncKnowledge,System.Object@)"]

knowledgeForDataRetrieval

Type: **SyncKnowledge**

[Missing <param name="knowledgeForDataRetrieval"/> documentation for "M:VelocityDBExtensions.SyncProvider.GetFullEnumerationChangeBatch(System.UInt32,Microsoft.Synchronization.SyncId,Microsoft.Synchronization.SyncKnowledge,System.Object@)"]

changeDataRetriever

Type: [System.Object](#)

[Missing <param name="changeDataRetriever"/> documentation for "M:VelocityDBExtensions.SyncProvider.GetFullEnumerationChangeBatch(System.UInt32,Microsoft.Synchronization.SyncId,Microsoft.Synchronization.SyncKnowledge,System.Object@)"]

Return Value

Type: **FullEnumerationChangeBatch**

[Missing <returns> documentation for "M:VelocityDBExtensions.SyncProvider.GetFullEnumerationChangeBatch(System.UInt32,Microsoft.Synchronization.SyncId,Microsoft.Synchronization.SyncKnowledge,System.Object@)"]

SyncProvider.GetHashCode Method

Serves as the default hash function.

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public override int GetHashCode()
```

VB

```
Public Overrides Function GetHashCode As Integer
```

C++

```
public:  
virtual int GetHashCode() override
```

F#

```
abstract GetHashCode : unit -> int  
override GetHashCode : unit -> int
```

Return Value

Type: [Int32](#)

A hash code for the current object.

Utilities Class

Currently only used by Database Manager

Inheritance Hierarchy

[System.Object](#)

VelocityDBExtensions.Utilities

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static class Utilities
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class Utilities
```

C++

```
[ExtensionAttribute]  
public ref class Utilities abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type Utilities = class end
```

The **Utilities** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
|  | ArrayToString | Outputs a string representing an array |
|  | ToStringDetails(OptimizedPersistable, SessionBase, Boolean) | Object details as a string |
|  | ToStringDetails(OptimizedPersistable, Schema, TypeVersion, Boolean) | Currently only used by Database Manager |
|  | ToStringDetails(DataMember, Object, IOptimizedPersistable, Page, Boolean) | This is a support function for the VelocityDbBrowser. It converts a field into a string. |

Utilities.ArrayToString Method

Outputs a string representing an array

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static string ArrayToString(  
    Array array,  
    bool isEncodedOidArray,  
    Page page,  
    Type elementType,  
    string prefix = ""  
)
```

VB

```
Public Shared Function ArrayToString (  
    array As Array,  
    isEncodedOidArray As Boolean,  
    page As Page,  
    elementType As Type,  
    Optional prefix As String = ""  
) As String
```

C++

```
public:  
static String^ ArrayToString(  
    Array^ array,  
    bool isEncodedOidArray,  
    Page^ page,  
    Type^ elementType,  
    String^ prefix = L""  
)
```

F#

```
static member ArrayToString :  
    array : Array *  
    isEncodedOidArray : bool *  
    page : Page *  
    elementType : Type *  
    ?prefix : string  
(* Defaults:  
    let _prefix = defaultArg prefix ""  
*)  
-> string
```

VelocityDB Class Library

Parameters

array

Type: [System.Array](#)

The array to represent as a string

isEncodedOidArray

Type: [System.Boolean](#)

True if [Oid](#) is encoded as a UInt32 or UInt64

page

Type: [VelocityDb.Page](#)

The page containing the array

elementType

Type: [System.Type](#)

The element [Type](#)

prefix (Optional)

Type: [System.String](#)

A prefix to use before each array element in the output string

Return Value

Type: [String](#)

A [String](#) representing the array.

    ?skipArrays : bool  
(* Defaults:  
    let skipArrays = defaultArg skipArrays true  
)  
-> string
```

Parameters

pObj

Type: [VelocityDb.OptimizedPersistable](#)

The object extended

session

Type: [VelocityDb.Session.SessionBase](#)

The session managing this object

skipArrays (Optional)

Type: [System.Boolean](#)

Indicates if string should contain detailed array data.

Return Value

Type: [String](#)

[String](#) containing all details of this object.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [OptimizedPersistable](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[Utilities Class](#)

[ToStringDetails Overload](#)

[VelocityDBExtensions Namespace](#)

Utilities.ToStringDetails Method (OptimizedPersistable, Schema, TypeVersion, Boolean)

Currently only used by Database Manager

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static string ToStringDetails(  
    this OptimizedPersistable pObj,  
    Schema schema,  
    TypeVersion typeVersion,  
    bool skipArrays  
)
```

VB

```
<ExtensionAttribute>  
Public Shared Function ToStringDetails (  
    pObj As OptimizedPersistable,  
    schema As Schema,  
    typeVersion As TypeVersion,  
    skipArrays As Boolean  
) As String
```

C++

```
public:  
[ExtensionAttribute]  
static String^ ToStringDetails(  
    OptimizedPersistable^ pObj,  
    Schema^ schema,  
    TypeVersion^ typeVersion,  
    bool skipArrays  
)
```

F#

```
[<ExtensionAttribute>]  
static member ToStringDetails :  
    pObj : OptimizedPersistable *  
    schema : Schema *  
    typeVersion : TypeVersion *  
    skipArrays : bool -> string
```

Parameters

pObj

Type: [VelocityDb.OptimizedPersistable](#)

Object for which we want detailed to string data

schema

Type: [VelocityDb.TypeInfo.Schema](#)

The active schema

typeVersion

Type: [VelocityDb.TypeInfo.TypeVersion](#)

describes the type of the pObj

skipArrays

Type: [System.Boolean](#)

if `true` include array data in generated string

Return Value

Type: [String](#)

content of an object as string

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [OptimizedPersistable](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[ToStringDetails Overload](#)

[VelocityDBExtensions Namespace](#)

Utilities.ToStringDetails Method (DataMember, Object, IOptimizedPersistable, Page, Boolean)

This is a support function for the VelocityDbBrowser. It converts a field into a string.

Namespace: [VelocityDBExtensions](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static string ToStringDetails(  
    DataMember member,  
    Object obj,  
    IOptimizedPersistable pObj,  
    Page page,  
    bool skipArrays  
)
```

VB

```
Public Shared Function ToStringDetails (  
    member As DataMember,  
    obj As Object,  
    pObj As IOptimizedPersistable,  
    page As Page,  
    skipArrays As Boolean  
) As String
```

C++

```
public:  
static String^ ToStringDetails(  
    DataMember^ member,  
    Object^ obj,  
    IOptimizedPersistable^ pObj,  
    Page^ page,  
    bool skipArrays  
)
```

F#

```
static member ToStringDetails :  
    member : DataMember *  
    obj : Object *  
    pObj : IOptimizedPersistable *  
    page : Page *  
    skipArrays : bool -> string
```

Parameters

member

Type: [VelocityDb.TypeInfo.DataMember](#)

VelocityDB Class Library

A field in an object

obj

Type: [System.Object](#)

The object containing the field

pObj

Type: [VelocityDb.IOptimizedPersistable](#)

[Missing <param name="pObj"/> documentation for

"M:VelocityDBExtensions.Utilities.ToStringDetails(VelocityDb.TypeInfo.DataMember,System.Object,VelocityDb.IOptimizedPersistable,VelocityDb.Page,System.Boolean)"]

page

Type: [VelocityDb.Page](#)

The page of the object

skipArrays

Type: [System.Boolean](#)

Option to skip arrays of the object

Return Value

Type: [String](#)

A [String](#) containing all details of this field.

[VelocityDb.OptimizedPersistable](#)

VelocityDBExtensions.CompressedBitArray.EwahCompressedBitArray

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
[SerializableAttribute]
public sealed class EwahCompressedBitArray : OptimizedPersistable,
    ICloneable, IEnumerable<int>, IEnumerable
```

VB

```
<SerializableAttribute>
Public NotInheritable Class EwahCompressedBitArray
    Inherits OptimizedPersistable
    Implements ICloneable, IEnumerable(Of Integer),
    IEnumerable
```

C++

```
[SerializableAttribute]
public ref class EwahCompressedBitArray sealed : public OptimizedPersistable,
    ICloneable, IEnumerable<int>, IEnumerable
```

F#

```
[<SealedAttribute>]
[<SerializableAttribute>]
type EwahCompressedBitArray =
    class
        inherit OptimizedPersistable
        interface ICloneable
        interface IEnumerable<int>
        interface IEnumerable
    end
```

The **EwahCompressedBitArray** type exposes the following members.

Constructors

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  EwahCompressedBitArray() | Creates an empty bitmap (no bit set to true). |
|  EwahCompressedBitArray(Int32) | Sets explicitly the buffer size (in 64-bit words). The initial memory usage will be "bufferize * 64". For large poorly compressible bitmaps, using large values may improve performance. |

Properties

| Name | Description |
|---------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  SizeInBits | The size in bits of the *uncompressed* bitmap represented by this compressed bitmap. Initially, the SizeInBits is zero. It is extended automatically when you set bits to true. |
|  SizeInBytes | Report the *compressed* size of the bitmap (equivalent to memory usage, after accounting for some overhead). |

Methods

| Name | Description |
|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  Add(Int64) | Adding words directly to the bitmap (for expert use). This is normally how you add data to the array. So you add bits in streams of 8*8 bits. |
|  Add(Int64, Int32) | Adding words directly to the bitmap (for expert use). |
|  AddStreamOfEmptyWords | For experts: You want to add many zeroes or ones? This is the method you use. |
|  And | Returns a new compressed bitmap containing the bitwise AND values of the current bitmap with some other bitmap. The running time is proportional to the sum of the compressed sizes (as reported by SizeInBytes). |
|  AndNot | Returns a new compressed bitmap containing the bitwise AND NOT values of the current bitmap with some other bitmap. The running time is proportional to the sum of the compressed sizes (as reported by SizeInBytes). |
|  bitCount | Counts the number of set (1) bits. |
|  BitmapOf | |
|  Clone | (Overrides OptimizedPersistable.Clone() .) |
|  Equals | Check to see whether the two compressed bitmaps contain the same data (effectively check whether the cardinality of a XOR is == 0. (Overrides OptimizedPersistable.Equals(Object) .) |
|  GetCardinality | reports the number of bits set to true. Running time is proportional to compressed size (as reported by SizeInBytes). |

| | |
|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  GetEnumerator | Iterator over the set bits (this is what most people will want to use to browse the content). The location of the set bits is returned, in increasing order. |
|  GetHashCode | Returns a customized hash code (based on Karp-Rabin). Naturally, if the bitmaps are equal, they will hash to the same value. (Overrides OptimizedPersistable.GetHashCode().) |
|  GetObjectData | |
|  GetPositions | get the locations of the true values as one vector. (may use more memory than GetEnumerator()) |
|  Intersects | Return true if the two EwahCompressedBitArray have both at least one true bit in the same Position. Equivalently, you could call "And" and check whether there is a set bit, but intersects will run faster if you don't need the result of the "and" operation. |
|  Not | Negate (bitwise) the current bitmap. To get a negated copy, do ((EwahCompressedBitArray) mybitmap.Clone()).not(); The running time is proportional to the compressed size (as reported by SizeInBytes). |
|  Or | Returns a new compressed bitmap containing the bitwise OR values of the current bitmap with some other bitmap. The running time is proportional to the sum of the compressed sizes (as reported by SizeInBytes). |
|  Set | set the bit at Position i to true, the bits must be set in increasing order. For example, Set(15) and then Set(7) will fail. You must do Set(7) and then Set(15). |
|  SetSizeInBits | Change the reported size in bits of the *uncompressed* bitmap represented by this compressed bitmap. It is not possible to reduce the SizeInBits, but it can be extended. The new bits are set to false or true depending on the value of defaultvalue. |
|  Shrink | Sets the internal buffer to the minimum possible size required to contain the current bitarray. This method is useful when dealing with static bitmaps, if it is called after the final bit has been set, some memory can be free-ed. Please note, the next bit set after a call to shrink will cause the memory usage of the bit-array to double. |
|  ToDebugString | A more detailed string describing the bitmap (useful for debugging). |
|  ToString | A string describing the bitmap (Overrides OptimizedPersistable.ToString().) |
|  Xor | Returns a new compressed bitmap containing the bitwise XOR values of the current bitmap with some other bitmap. The running time is proportional to the sum of the compressed sizes (as reported by SizeInBytes). |

Fields

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|------------------------------|
|  | WordInBits | the number of bits in a long |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

[EwahCompressedBitArray Class](#)

[VelocityDBExtensions.CompressedBitArray Namespace](#)

EwahCompressedBitmap.Equals Method

Check to see whether the two compressed bitmaps contain the same data (effectively check whether the cardinality of a XOR is == 0).

Namespace: [VelocityDBExtensions.CompressedBitmapArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public override bool Equals(  
    Object o  
)
```

VB

```
Public Overrides Function Equals (  
    o As Object  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    Object^ o  
) override
```

F#

```
abstract Equals :  
    o : Object -> bool  
override Equals :  
    o : Object -> bool
```

Parameters

o

Type: [System.Object](#)

the other bitmap

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for

"M:VelocityDBExtensions.CompressedBitmapArray.EwahCompressedBitmapArray.Equals(System.Object)"]

See Also

[EwahCompressedBitArray Class](#)

[VelocityDBExtensions.CompressedBitArray Namespace](#)

EwahCompressedBitArray.Intersects Method

Return true if the two EwahCompressedBitArray have both at least one true bit in the same Position. Equivalently, you could call "And" and check whether there is a set bit, but intersects will run faster if you don't need the result of the "and" operation.

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public bool Intersects (
    EwahCompressedBitArray a
)
```

VB

```
Public Function Intersects (
    a As EwahCompressedBitArray
) As Boolean
```

C++

```
public:
bool Intersects (
    EwahCompressedBitArray^ a
)
```

F#

```
member Intersects :
    a : EwahCompressedBitArray -> bool
```

Parameters

a

Type: [VelocityDBExtensions.CompressedBitArray.EwahCompressedBitArray](#)

[Missing <param name="a"/> documentation for

"M:VelocityDBExtensions.CompressedBitArray.EwahCompressedBitArray.Intersects(VelocityDBExtensions.CompressedBitArray.EwahCompressedBitArray)"]

Return Value

Type: [Boolean](#)

[Missing <returns> documentation for

EwahCompressedBitmap.Not Method

Negate (bitwise) the current bitmap. To get a negated copy, do ((EwahCompressedBitmap) mybitmap.Clone()).not(); The running time is proportional to the compressed size (as reported by SizeInBytes).

Namespace: [VelocityDBExtensions.CompressedBitmap](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public void Not ()
```

VB

```
Public Sub Not
```

C++

```
public:  
void Not ()
```

F#

```
member Not : unit -> unit
```

See Also

[EwahCompressedBitmap Class](#)

[VelocityDBExtensions.CompressedBitmap Namespace](#)

EwahCompressedBitmap.Or Method

Returns a new compressed bitmap containing the bitwise OR values of the current bitmap with some other bitmap. The running time is proportional to the sum of the compressed sizes (as reported by `SizeInBytes`).

Namespace: [VelocityDBExtensions.CompressedBitmap](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public EwahCompressedBitmap Or (  
    EwahCompressedBitmap a  
)
```

VB

```
Public Function Or (  
    a As EwahCompressedBitmap  
) As EwahCompressedBitmap
```

C++

```
public:  
EwahCompressedBitmap^ Or(  
    EwahCompressedBitmap^ a  
)
```

F#

```
member Or :  
    a : EwahCompressedBitmap -> EwahCompressedBitmap
```

Parameters

a

Type: [VelocityDBExtensions.CompressedBitmap.EwahCompressedBitmap](#)

the other bitmap

Return Value

Type: [EwahCompressedBitmap](#)

the EWAH compressed bitmap

See Also

[EwahCompressedBitmap Class](#)

[VelocityDBExtensions.CompressedBitmap Namespace](#)

EwahCompressedBitArray.Set Method

set the bit at Position *i* to true, the bits must be set in increasing order. For example, Set(15) and then Set(7) will fail. You must do Set(7) and then Set(15).

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public bool Set(  
    int i  
)
```

VB

```
Public Function Set (  
    i As Integer  
) As Boolean
```

C++

```
public:  
bool Set(  
    int i  
)
```

F#

```
member Set :  
    i : int -> bool
```

Parameters

i

Type: [System.Int32](#)

the index

Return Value

Type: [Boolean](#)

true if the value was set (always true when $i \geq \text{SizeInBits}$)

See Also

[EwahCompressedBitArray Class](#)

[VelocityDBExtensions.CompressedBitArray Namespace](#)

EwahCompressedBitmap.SetSizeInBits Method

Change the reported size in bits of the *uncompressed* bitmap represented by this compressed bitmap. It is not possible to reduce the SizeInBits, but it can be extended. The new bits are set to false or true depending on the value of defaultvalue.

Namespace: [VelocityDBExtensions.CompressedBitmap](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public bool SetSizeInBits(  
    int size,  
    bool defaultvalue  
)
```

VB

```
Public Function SetSizeInBits (  
    size As Integer,  
    defaultvalue As Boolean  
) As Boolean
```

C++

```
public:  
bool SetSizeInBits(  
    int size,  
    bool defaultvalue  
)
```

F#

```
member SetSizeInBits :  
    size : int *  
    defaultvalue : bool -> bool
```

Parameters

size

Type: [System.Int32](#)

the size in bits

defaultvalue

Type: [System.Boolean](#)

the default bool value

Return Value

Type: [Boolean](#)

true if the update was possible

VelocityDB Class Library

[EwahCompressedBitArray Class](#)

[VelocityDBExtensions.CompressedBitArray Namespace](#)

EwahCompressedBitArray.Shrink Method

Sets the internal buffer to the minimum possible size required to contain the current bitarray. This method is useful when dealing with static bitmaps, if it is called after the final bit has been set, some memory can be free-ed. Please note, the next bit set after a call to shrink will cause the memory usage of the bit-array to double.

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public void Shrink()
```

VB

```
Public Sub Shrink
```

C++

```
public:  
void Shrink()
```

F#

```
member Shrink : unit -> unit
```

EwahCompressedBitmap.Xor Method

Returns a new compressed bitmap containing the bitwise XOR values of the current bitmap with some other bitmap. The running time is proportional to the sum of the compressed sizes (as reported by SizeInBytes).

Namespace: [VelocityDBExtensions.CompressedBitmap](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public EwahCompressedBitmap Xor(  
    EwahCompressedBitmap a  
)
```

VB

```
Public Function Xor (  
    a As EwahCompressedBitmap  
) As EwahCompressedBitmap
```

C++

```
public:  
EwahCompressedBitmap^ Xor(  
    EwahCompressedBitmap^ a  
)
```

F#

```
member Xor :  
    a : EwahCompressedBitmap -> EwahCompressedBitmap
```

Parameters

a

Type: [VelocityDBExtensions.CompressedBitmap.EwahCompressedBitmap](#)

the other bitmap

Return Value

Type: [EwahCompressedBitmap](#)

the EWAH compressed bitmap

EwahEnumerator Class

The class EwahEnumerator represents a special type of efficient enumerator iterating over (uncompressed) words of bits.

Inheritance Hierarchy

[System.Object](#)

VelocityDBExtensions.CompressedBitArray.EwahEnumerator

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

```
C#
public sealed class EwahEnumerator
```

```
VB
Public NotInheritable Class EwahEnumerator
```

```
C++
public ref class EwahEnumerator sealed
```

```
F#
[<SealedAttribute>]
type EwahEnumerator = class end
```

The **EwahEnumerator** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|--------------------------------|------------------------------------|
|  | EwahEnumerator | Instantiates a new eWAH enumerator |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|---------------------------------------------------------------------|
|  | Buffer | Access to the array of words |
|  | DirtyWords | Position of the dirty words represented by this running length word |

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------|--------------------------|
|  | HasNext | Checks for next |
|  | Next | Next running length word |

Fields

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------|-----------------------------|
|  | _Rlw | current running length word |

Inheritance Hierarchy

[System.Object](#)

[VelocityDb.OptimizedPersistable](#)

VelocityDBExtensions.CompressedBitArray.RunningLengthWord

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public sealed class RunningLengthWord : OptimizedPersistable
```

VB

```
Public NotInheritable Class RunningLengthWord  
    Inherits OptimizedPersistable
```

C++

```
public ref class RunningLengthWord sealed : public OptimizedPersistable
```

F#

```
[<SealedAttribute>]  
type RunningLengthWord =  
    class  
        inherit OptimizedPersistable  
    end
```

The **RunningLengthWord** type exposes the following members.

Properties

| Name | Description |
|--------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
|  Count | Return the size in uncompressed words represented by this running length word. |
|  NumberOfLiteralWords | the number of literal words |
|  RunningBit | the running bit |
|  RunningLength | the running length |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------|---------------------------------------------------------------|
|  | Clone | (Overrides OptimizedPersistable.Clone() .) |
|  | ToString | (Overrides OptimizedPersistable.ToString() .) |

Fields

| | Name | Description |
|-----------------------------------------------------------------------------------|-------------------------------------------|--------------------------------------------------------------------------|
|  | ArrayOfWords | The array of words. |
|  | LargestLiteralCount | largest number of dirty words in a run |
|  | LargestRunningLengthCount | largest number of clean words in a run |
|  | Position | The Position in array. |
|  | RunningLengthBits | number of bits dedicated to marking of the running length of clean words |

Extension Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities.) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities.) |

RunningLengthWord.Count Property

Return the size in uncompressed words represented by this running length word.

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public long Count { get; }
```

VB

```
Public ReadOnly Property Count As Long  
    Get
```

C++

```
public:  
property long long Count {  
    long long get ();  
}
```

F#

```
member Count : int64 with get
```

Return Value

Type: [Int64](#)

RunningLengthWord.NumberOfLiteralWords Property

the number of literal words

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public long NumberOfLiteralWords { get; set; }
```

VB

```
Public Property NumberOfLiteralWords As Long  
    Get  
    Set
```

C++

```
public:  
property long long NumberOfLiteralWords {  
    long long get ();  
    void set (long long value);  
}
```

F#

```
member NumberOfLiteralWords : int64 with get, set
```

Property Value

Type: [Int64](#)

RunningLengthWord.RunningLengthWord Methods

The [RunningLengthWord](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|--------------------------|---------------------------------------------------------------|
|  | Clone | (Overrides OptimizedPersistable.Clone() .) |
|  | ToString | (Overrides OptimizedPersistable.ToString() .) |

Extension Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------|----------------------------------------------------------------------------------------------|
|  | ToStringDetails(SessionBase, Boolean) | Overloaded. Object details as a string (Defined by Utilities .) |
|  | ToStringDetails(Schema, TypeVersion, Boolean) | Overloaded. Currently only used by Database Manager (Defined by Utilities .) |

RunningLengthWord.RunningLengthWord Fields

The [RunningLengthWord](#) type exposes the following members.

Fields

| | Name | Description |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|--------------------------------------------------------------------------|
|  | ArrayOfWords | The array of words. |
|   | LargestLiteralCount | largest number of dirty words in a run |
|   | LargestRunningLengthCount | largest number of clean words in a run |
|  | Position | The Position in array. |
|   | RunningLengthBits | number of bits dedicated to marking of the running length of clean words |

RunningLengthWord.ArrayOfWords Field

The array of words.

Namespace: [VelocityDBExtensions.CompressedBitArray](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public long[] ArrayOfWords
```

VB

```
Public ArrayOfWords As Long()
```

C++

```
public:  
array<long long>^ ArrayOfWords
```

F#

```
val mutable ArrayOfWords: int64[]
```

Field Value

Type: [Int64](#)[]

|  | BTreeExtensions | A few extensions to improve performance of Linq for Objects queries We need your HELP to improve it to cover more use cases of queries! |

BTreeExtensions Class

A few extensions to improve performance of Linq for Objects queries We need your HELP to improve it to cover more use cases of queries!

Inheritance Hierarchy

[System.Object](#)

VelocityDBExtensions.Extensions.BTree.BTreeExtensions

Namespace: [VelocityDBExtensions.Extensions.BTree](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static class BTreeExtensions
```

VB

```
<ExtensionAttribute>  
Public NotInheritable Class BTreeExtensions
```

C++

```
[ExtensionAttribute]  
public ref class BTreeExtensions abstract sealed
```

F#

```
[<AbstractClassAttribute>]  
[<SealedAttribute>]  
[<ExtensionAttribute>]  
type BTreeExtensions = class end
```

The **BTreeExtensions** type exposes the following members.

Methods

| | Name | Description |
|-------------------------------------------------------------------------------------|----------------------------|-----------------------------------------------------------------|
|  | Count(Key) | Override to improve performance over IEnumerable LINQ extension |
|  | Where(Key) | Override to improve performance over IEnumerable LINQ extension |

See Also

[VelocityDBExtensions.Extensions.BTree Namespace](#)

BTreeExtensions.BTreeExtensions Methods

The [BTreeExtensions](#) type exposes the following members.

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|----------------------------|-----------------------------------------------------------------|
|  | Count(Key) | Override to improve performance over IEnumerable LINQ extension |
|  | Where(Key) | Override to improve performance over IEnumerable LINQ extension |

See Also

[BTreeExtensions Class](#)

[VelocityDBExtensions.Extensions.BTree Namespace](#)

BTreeExtensions.Count(Key) Method

Override to improve performance over IEnumerable LINQ extension

Namespace: [VelocityDBExtensions.Extensions.BTree](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static int Count<Key>(
    this BTreeBase<Key, Key> sourceCollection
)
```

VB

```
<ExtensionAttribute>
Public Shared Function Count(Of Key) (
    sourceCollection As BTreeBase(Of Key, Key)
) As Integer
```

C++

```
public:
    [ExtensionAttribute]
    generic<typename Key>
    static int Count(
        BTreeBase<Key, Key>^ sourceCollection
    )
```

F#

```
[<ExtensionAttribute>]
static member Count :
    sourceCollection : BTreeBase<'Key, 'Key> -> int
```

Parameters

sourceCollection

Type: [VelocityDb.Collection.BTree.BTreeBase\(Key, Key\)](#)

the collection

Type Parameters

Key

key type

Return Value

Type: [Int32](#)

Size of the collection

VelocityDB Class Library

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [BTreeBase](#)(**Key**, **Key**). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

See Also

[BTreeExtensions Class](#)

[VelocityDBExtensions.Extensions.BTree Namespace](#)

BTreeExtensions.Where(Key) Method

Override to improve performance over IEnumerable LINQ extension

Namespace: [VelocityDBExtensions.Extensions.BTree](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public static IEnumerable<Key> Where<Key>(
    this BTreeBase<Key, Key> sourceCollection,
    Expression<Func<Key, bool>> expr
)
```

VB

```
<ExtensionAttribute>
Public Shared Function Where(Of Key) (
    sourceCollection As BTreeBase(Of Key, Key),
    expr As Expression(Of Func(Of Key, Boolean))
) As IEnumerable(Of Key)
```

C++

```
public:
[ExtensionAttribute]
generic<typename Key>
static IEnumerable<Key>^ Where(
    BTreeBase<Key, Key>^ sourceCollection,
    Expression<Func<Key, bool>>^ expr
)
```

F#

```
[<ExtensionAttribute>]
static member Where :
    sourceCollection : BTreeBase<'Key, 'Key> *
    expr : Expression<Func<'Key, bool>> -> IEnumerable<'Key>
```

Parameters

sourceCollection

Type: [VelocityDb.Collection.BTree.BTreeBase\(Key, Key\)](#)

the collection

expr

Type: [System.Linq.Expressions.Expression\(Func\(Key, Boolean\)\)](#)

an expression

Type Parameters

Key

key type

Return Value

Type: [IEnumerable\(Key\)](#)

Enumeration of collection where the expression evaluates to true

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [BTreeBase\(Key, Key\)](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

[VelocityDBExtensions.Extensions.BTree Namespace](#)

VelocityDBExtensions.Geo Namespace

The `VelocityDB.geohash` namespace contains classes for creating GeoHash based on Longitude and Latitude, see <https://en.wikipedia.org/wiki/Geohash> Ported to C# from Java by Mats Persson, VelocityDB, Inc. original Java code, see <https://github.com/kungfoo/geohash-java> Copyright 2010, Silvio Heuberger @ IFS www.ifs.hsr.ch This code is release under the Apache License 2.0. <http://www.apache.org/licenses/LICENSE-2.0>

Classes

| | Class | Description |
|-----------------------------------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------|
|  | BoundingBox | Rectangular bounding box which is used to describe the bounds of a GeoHash query |
|  | GeoHash | See https://en.wikipedia.org/wiki/Geohash |
|  | WGS84Point | encapsulates coordinates on the earths surface. Coordinate projections might end up using this class... |

BoundingBox Class

Rectangular bounding box which is used to describe the bounds of a GeoHash query

Inheritance Hierarchy

[System.Object](#)

VelocityDBExtensions.Geo.BoundingBox

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
[SerializableAttribute]
public class BoundingBox
```

VB

```
<SerializableAttribute>
Public Class BoundingBox
```

C++

```
[SerializableAttribute]
public ref class BoundingBox
```

F#

```
[<SerializableAttribute>]
type BoundingBox = class end
```

The **BoundingBox** type exposes the following members.

Constructors

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------|---------------------------------------------------------------|
|  | BoundingBox(BoundingBox) | Clones an existing BoundingBox |
|  | BoundingBox(WGS84Point, WGS84Point) | create a bounding box defined by two coordinates |
|  | BoundingBox(Double, Double, Double, Double) | create a bounding box defined by four Doubles |

Properties

| | Name | Description |
|-------------------------------------------------------------------------------------|-------------------------------|--------------------------------------------------------------|
|  | CenterPoint | Center WGS84Point of this BoundingBox |
|  | LatitudeSize | Max Latitude - Min Latitude |
|  | LongitudeSize | Max Longitude - Min Longitude |
|  | LowerRight | Lower right corner |

| | | |
|-----------------------------------------------------------------------------------|---------------------------|----------------------------------------------|
|  | MaxLat | Maximum Latitude of this BoundingBox |
|  | MaxLon | Maximum Longitude of this BoundingBox |
|  | MinLat | Minimum Latitude of this BoundingBox |
|  | MinLon | Minimum Longitude of this BoundingBox |
|  | UpperLeft | Upper left corner |

Methods

| | Name | Description |
|-----------------------------------------------------------------------------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
|  | Contains | Is WGS84Point within BoundingBox |
|  | Equals | Determines whether the specified object is equal to the current object. (Overrides Object.Equals(Object) .) |
|  | ExpandToInclude | Expand this BoundingBox to include other BoundingBox |
|  | GetHashCode | Serves as the default hash function. (Overrides Object.GetHashCode() .) |
|  | Intersects | Does this BoundingBox intersect (overlap) with other BoundingBox |
|  | ToString | Returns a string that represents the current object. (Overrides Object.ToString() .) |

BoundingBox Constructor (BoundingBox)

Clones an existing [BoundingBox](#)

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public BoundingBox(  
    BoundingBox that  
)
```

VB

```
Public Sub New (  
    that As BoundingBox  
)
```

C++

```
public:  
BoundingBox(  
    BoundingBox^ that  
)
```

F#

```
new :  
    that : BoundingBox -> BoundingBox
```

Parameters

that

Type: [VelocityDBExtensions.Geo.BoundingBox](#)

to be cloned

[BoundingBox Overload](#)

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox Constructor (WGS84Point, WGS84Point)

create a bounding box defined by two coordinates

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public BoundingBox(  
    WGS84Point p1,  
    WGS84Point p2  
)
```

VB

```
Public Sub New (  
    p1 As WGS84Point,  
    p2 As WGS84Point  
)
```

C++

```
public:  
BoundingBox(  
    WGS84Point^ p1,  
    WGS84Point^ p2  
)
```

F#

```
new :  
    p1 : WGS84Point *  
    p2 : WGS84Point -> BoundingBox
```

Parameters

p1

Type: [VelocityDBExtensions.Geo.WGS84Point](#)

[Missing <param name="p1"/> documentation for "M:VelocityDBExtensions.Geo.BoundingBox.#ctor(VelocityDBExtensions.Geo.WGS84Point,VelocityDBExtensions.Geo.WGS84Point)"]

p2

Type: [VelocityDBExtensions.Geo.WGS84Point](#)

[Missing <param name="p2"/> documentation for "M:VelocityDBExtensions.Geo.BoundingBox.#ctor(VelocityDBExtensions.Geo.WGS84Point,VelocityDBExtensions.Geo.WGS84Point)"]

F#

```
abstract MaxLon : float with get  
override MaxLon : float with get
```

Property Value

Type: [Double](#)

See Also

[BoundingBox Class](#)

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.MinLat Property

Minimum Latitude of this [BoundingBox](#)

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public virtual double MinLat { get; }
```

VB

```
Public Overridable ReadOnly Property MinLat As Double  
    Get
```

C++

```
public:  
virtual property double MinLat {  
    double get ();  
}
```

F#

```
abstract MinLat : float with get  
override MinLat : float with get
```

Property Value

Type: [Double](#)

[BoundingBox Class](#)

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.MinLon Property

Minimum Longitude of this [BoundingBox](#)

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public virtual double MinLon { get; }
```

VB

```
Public Overridable ReadOnly Property MinLon As Double  
    Get
```

C++

```
public:  
virtual property double MinLon {  
    double get ();  
}
```

F#

```
abstract MinLon : float with get  
override MinLon : float with get
```

Property Value

Type: [Double](#)

BoundingBox.UpperLeft Property

Upper left corner

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public virtual WGS84Point UpperLeft { get; }
```

VB

```
Public Overridable ReadOnly Property UpperLeft As WGS84Point  
    Get
```

C++

```
public:  
virtual property WGS84Point^ UpperLeft {  
    WGS84Point^ get ();  
}
```

F#

```
abstract UpperLeft : WGS84Point with get  
override UpperLeft : WGS84Point with get
```

Property Value

Type: [WGS84Point](#)

BoundingBox.BoundingBox Methods

The [BoundingBox](#) type exposes the following members.

Methods

| Name | Description |
|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
|  Contains | Is WGS84Point within BoundingBox |
|  Equals | Determines whether the specified object is equal to the current object. (Overrides Object.Equals(Object) .) |
|  ExpandToInclude | Expand this BoundingBox to include other BoundingBox |
|  GetHashCode | Serves as the default hash function. (Overrides Object.GetHashCode() .) |
|  Intersects | Does this BoundingBox intersect (overlap) with other BoundingBox |
|  ToString | Returns a string that represents the current object. (Overrides Object.ToString() .) |

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.Contains Method

Is [WGS84Point](#) within [BoundingBox](#)

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public virtual bool Contains(  
    WGS84Point point  
)
```

VB

```
Public Overridable Function Contains (  
    point As WGS84Point  
) As Boolean
```

C++

```
public:  
virtual bool Contains(  
    WGS84Point^ point  
)
```

F#

```
abstract Contains :  
    point : WGS84Point -> bool  
override Contains :  
    point : WGS84Point -> bool
```

Parameters

point

Type: [VelocityDBExtensions.Geo.WGS84Point](#)
[WGS84Point](#)

for containment check

Return Value

Type: [Boolean](#)

true if contained; otherwise false

See Also

[BoundingBox Class](#)

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.Equals Method

Determines whether the specified object is equal to the current object.

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public override bool Equals(  
    Object obj  
)
```

VB

```
Public Overrides Function Equals (  
    obj As Object  
) As Boolean
```

C++

```
public:  
virtual bool Equals(  
    Object^ obj  
) override
```

F#

```
abstract Equals :  
    obj : Object -> bool  
override Equals :  
    obj : Object -> bool
```

Parameters

obj

Type: [System.Object](#)

The object to compare with the current object.

Return Value

Type: [Boolean](#)

`true` (`True` in Visual Basic) if the specified object is equal to the current object; otherwise, `false` (`False` in Visual Basic).

BoundingBox.ExpandToInclude Method

Expand this [BoundingBox](#) to include other [BoundingBox](#)

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public virtual void ExpandToInclude (  
    BoundingBox other  
)
```

VB

```
Public Overridable Sub ExpandToInclude (  
    other As BoundingBox  
)
```

C++

```
public:  
virtual void ExpandToInclude (  
    BoundingBox^ other  
)
```

F#

```
abstract ExpandToInclude :  
    other : BoundingBox -> unit  
override ExpandToInclude :  
    other : BoundingBox -> unit
```

Parameters

other

Type: [VelocityDBExtensions.Geo.BoundingBox](#)

Other [BoundingBox](#) to be included

See Also

[BoundingBox Class](#)

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.GetHashCode Method

Serves as the default hash function.

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public override int GetHashCode()
```

VB

```
Public Overrides Function GetHashCode As Integer
```

C++

```
public:  
virtual int GetHashCode() override
```

F#

```
abstract GetHashCode : unit -> int  
override GetHashCode : unit -> int
```

Return Value

Type: [Int32](#)

A hash code for the current object.

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.Intersects Method

Does this [BoundingBox](#) intersect (overlap) with other [BoundingBox](#)

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public virtual bool Intersects(  
    BoundingBox other  
)
```

VB

```
Public Overridable Function Intersects (  
    other As BoundingBox  
) As Boolean
```

C++

```
public:  
virtual bool Intersects(  
    BoundingBox^ other  
)
```

F#

```
abstract Intersects :  
    other : BoundingBox -> bool  
override Intersects :  
    other : BoundingBox -> bool
```

Parameters

other

Type: [VelocityDBExtensions.Geo.BoundingBox](#)

Other [BoundingBox](#)

Return Value

Type: [Boolean](#)

true if intersect; otherwise false

[BoundingBox Class](#)

[VelocityDBExtensions.Geo Namespace](#)

BoundingBox.ToString Method

Returns a string that represents the current object.

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
public override string ToString()
```

VB

```
Public Overrides Function ToString As String
```

C++

```
public:  
virtual String^ ToString() override
```

F#

```
abstract ToString : unit -> string  
override ToString : unit -> string
```

Return Value

Type: [String](#)

A string that represents the current object.

Inheritance Hierarchy

[System.Object](#)

VelocityDBExtensions.Geo.GeoHash

Namespace: [VelocityDBExtensions.Geo](#)

Assembly: VelocityDBExtensions (in VelocityDBExtensions.dll) Version: 11.1.0.0 (11.1.0)

Syntax

C#

```
[SerializableAttribute]
public sealed class GeoHash : IComparable<GeoHash>
```

VB

```
<SerializableAttribute>
Public NotInheritable Class GeoHash
    Implements IComparable(Of GeoHash)
```

C++

```
[SerializableAttribute]
public ref class GeoHash sealed : IComparable<GeoHash^>
```

F#

```
[<SealedAttribute>]
[<SerializableAttribute>]
type GeoHash =
    class
        interface IComparable<GeoHash>
    end
```
